N. W. Smith (June 1980 Revision)

Bell Laboratories Piscataway, New Jersey 08854

#### 1. INTRODUCTION

#### 1.1 Purpose

This memorandum is the user's guide and reference manual for the Memorandum Macros (MM), a general-purpose package of text formatting macros for use with the UNIX† text formatters nroff and troff.

The purpose of MM is to provide a unified, consistent, and flexible tool for producing many common types of documents. Although the UNIX time-sharing system provides other macro packages for various specialized formats, MM has become the standard, general-purpose macro package for most documents.

MM can be used to produce:

- Letters
- Reports
- Technical Memoranda
- Released Papers
- Manuals
- · Books.

The uses of MM range from single-page letters to documents of several hundred pages in length, such as user guides, design proposals, etc.

## 1.2 Conventions

Each section of this memorandum explains a single facility of MM. In general, the earlier a section occurs, the more necessary it is for most users. Some of the later sections can be completely ignored if MM defaults are acceptable. Likewise, each section progresses from normal-case to special-case facilities. We recommend reading a section in detail only until there is enough information to obtain the desired format, then skimming the rest of it, because some details may be of use to just a few people.

Numbers enclosed in curly brackets ({}) refer to section numbers within this document. For example, this is {1.2}.

Sections that require knowledge of the formatters {1.4} have a bullet (•) at the end of their headings.

In the synopses of macro calls, square brackets ([]) surrounding an argument indicate that it is optional. Ellipses (...) show that the preceding argument may appear more than once.

A reference of the form name (N) points to page name in section N of the UNIX User's Manual [1].

The examples of *output* in this manual are as produced by *troff*; *nroff* output would, of course, look somewhat different (Appendix C shows both *nroff* and *troff* outputs for a simple letter). In those cases in which the behavior of the two formatters is truly different, the *nroff* action is described first, with the *troff* action following in parentheses. For example:

<sup>†</sup> UNIX is a trademark of Bell Laboratories.

The title is underlined (italic).

means that the title is underlined in nroff and italic in troff.

#### 1.3 Overall Structure of a Document

The input for a document that is to be formatted with MM possesses four major segments, any of which may be omitted; if present, they must occur in the following order:

- Parameter-setting—This segment sets the general style and appearance of a document. The user can control page width, margin justification, numbering styles for headings and lists, page headers and footers {9}, and many other properties of the document. Also, the user can add macros or redefine existing ones. This segment can be omitted entirely if one is satisfied with default values; it produces no actual output, but only performs the setup for the rest of the document.
- Beginning—This segment includes those items that occur only once, at the beginning of a document, e.g., title, author's name, date.
- Body—This segment is the actual text of the document. It may be as small as a single paragraph, or as large as hundreds of pages. It may have a hierarchy of headings up to seven levels deep {4}. Headings are automatically numbered (if desired) and can be saved to generate the table of contents. Five additional levels of subordination are provided by a set of list macros for automatic numbering, alphabetic sequencing, and "marking" of list items {5}. The body may also contain various types of displays, tables, figures, references, and footnotes {7, 8, 11}.
- Ending—This segment contains those items that occur once only, at the end of a document. Included here are signature(s) and lists of notations (e.g., "copy to" lists) {6.11}. Certain macros may be invoked here to print information that is wholly or partially derived from the rest of the document, such as the table of contents or the cover sheet for a document {10}.

The existence and size of these four segments varies widely among different document types. Although a specific item (such as date, title, author name(s), etc.) may be printed in several different ways depending on the document type, there is a uniform way of typing it in.

## 1.4 Definitions

The term formatter refers to either of the text-formatting programs nroff and troff.

Requests are built-in commands recognized by the formatters. Although one seldom needs to use these requests directly {3.10}, this document contains references to some of them. Full details are given in the NROFF/TROFF User's Manual [2]. For example, the request:

.sp

inserts a blank line in the output.

Macros are named collections of requests. Each macro is an abbreviation for a collection of requests that would otherwise require repetition. MM supplies many macros, and the user can define additional ones. Macros and requests share the same set of names and are used in the same way.

Strings provide character variables, each of which names a string of characters. Strings are often used in page headers, page footers, and lists. They share the pool of names used by requests and macros. A string can be given a value via the .ds (define string) request, and its value can be obtained by referencing its name, preceded by "\\*" (for 1-character names) or "\\*(") (for 2-character names). For instance, the string DT in MM normally contains the current date, so that the input line:

Today is \\*(DT.

may result in the following output:

Today is March 27, 1981.

The current date can be replaced, e.g.:

.ds DT 01/01/79

or by invoking a macro designed for that purpose {6.7.1}.

Number registers fill the role of integer variables. They are used for flags, for arithmetic, and for automatic numbering. A register can be given a value using a .nr request, and be referenced by preceding its name by "\n" (for 1-character names) or "\n(" (for 2-character names). For example, the following sets the value of the register d to 1 more than that of the register dd:

.nr d  $1+\n(dd$ 

See {14.1} regarding naming conventions for requests, macros, strings, and number registers. Appendix E list all macros, strings, and number registers defined in MM.

## 1.5 Prerequisites and Further Reading

- 1.5.1 Prerequisites. We assume familiarity with UNIX at the level given in UNIX for Beginners [3] and A Tutorial Introduction to the UNIX Text Editor [4]. Some familiarity with the request summary in the NROFF/TROFF User's Manual [2] is helpful.
- 1.5.2 Further Reading. NROFF/TROFF User's Manual [2] provides detailed descriptions of formatter capabilities, while A TROFF Tutorial [5] provides a general overview. See Typesetting Mathematics—User's Guide [6] for instructions on formatting mathematical expressions. See tbl(1) and TBL—A Program to Format Tables [7] for instructions on formatting tabular data.

Examples of formatted documents and of their respective input, as well as a quick reference to the material in this manual are given in Typing Documents with MM [8].

#### 2. INVOKING THE MACROS

This section tells how to access MM, shows UNIX command lines appropriate for various output devices, and describes command-line flags for MM.

## 2.1 The mm Command

The mm(1) command can be used to print documents using nroff and MM; this command invokes nroff with the —cm flag  $\{2.2\}$ . It has options to specify preprocessing by tbl and/or by neqn and for postprocessing by various output filters. Any arguments or flags that are not recognized by mm(1), e.g. —rC3, are passed to nroff or to MM, as appropriate. The options, which can occur in any order but must appear before the file names, are:

—е	neqn is to be invoked; also causes neqn to read /usr/pub/eqnchar (see eqnchar(7)).
-t	tbl(1) is to be invoked.
-c	col(1) is to be invoked.
-E	the -e option of <i>nroff</i> is to be invoked.
-y	-mm (uncompacted macros) is to be used instead of -cm.
-12	12-pitch mode is to be used. Be sure the pitch switch on the terminal is set to 12.
-T450	output is to a DASI 450. This is the default terminal type (unless \$TERM is set).
	It is also equivalent to -T1620.
-T450-1	2 output is to a DASI 450 in 12-pitch mode.
-T300	output is to a DASI 300 terminal.
-T300-1	2 output is to a DASI 300 in 12-pitch mode.
-T300s	output is to a DASI 300S.
-T300s-	12 output is to a DASI 300S in 12-pitch mode.
-T4014	output is to a Tektronix 4014.
-T37	output is to a TELETYPE® Model 37.
-T382	output is to a DTC-382.
-T4000a	output is to a Trendata 4000A.

-TXoutput is prepared for an EBCDIC line printer. -Thp output is to a HP264x (implies -c). -T43 output is to a TELETYPE Model 43 (implies -c). output is to a TELETYPE Model 40/4 (implies -c). -T40/4-T745output is to a Texas Instrument 700 series terminal (implies -c). -T2631 output is prepared for a HP2631 printer (where -T2631-e and -T2631-c may be used for expanded and compressed modes, respectively) (implies -c). -Tlp output is to a device with no reverse or partial line motions or other special features (implies -c).

Any other -T option given does not produce an error; it is equivalent to -Tlp.

A similar command is available for use with troff (see mmt (1)).

# 2.2 The -cm or -mm Flag

The MM package can also be invoked by including the —cm or —mm flag as an argument to the formatter. The —cm flag causes the pre-compacted version of the macros to be loaded. The —mm flag causes the file /usr/lib/tmac/tmac.m to be read and processed before any other files. This action defines the MM macros, sets default values for various parameters, and initializes the formatter to be ready to process the files of input text.

# 2.3 Typical Command Lines

The prototype command lines are as follows (with the various options explained in {2.4} and in the NROFF/TROFF User's Manual [2]).

• Text without tables or equations:

```
mm [options] file-name ...

or nroff [options] -cm file-name ...

mmt [options] file-name ...

or troff [options] -cm file-name ...
```

• Text with tables:

```
mm -t [options] file-name ...

or tbl file-name ... | nroff [options] -cm

mmt -t [options] file-name ...

or tbl file-name ... | troff [options] -cm
```

• Text with equations:

```
mm -e [options] file-name ...

or neqn /usr/pub/eqnchar file-name ... | nroff [options] -cm
mmt -e [options] file-name ... | troff [options] -cm

or eqn /usr/pub/eqnchar file-name ... | troff [options] -cm
```

• Text with both tables and equations:

```
mm -t -e [options] file-name ...
or tbl file-name ... | neqn /usr/pub/eqnchar - | nroff [options] -cm
mmt -t -e [options] file-name ...
or tbl file-name ... | eqn /usr/pub/eqnchar - | troff [options] -cm
```

When formatting a document with nroff, the output should normally be processed for a specific type of terminal, because the output may require some features that are specific to a given terminal, e.g., reverse paper motion or half-line paper motion in both directions. Some commonly-used terminal types and the command lines appropriate for them are given below. See  $\{2.4\}$  as well as 300(1), 450(1), 4014(1), hp(1), col(1), and terminals (7) for further information.

DASI 450 in 10-pitch, 6 lines/inch mode, with 0.75 inch offset, and a line length of 6 inches (60 characters) where this is the default terminal type so no -T option is needed (unless \$TERM is set to another value):

```
mm file-name ...
or nroff -T450 -h -cm file-name ...
```

• DASI 450 in 12-pitch, 6 lines/inch mode, with 0.75 inch offset, and a line length of 6 inches (72 characters):

```
mm -12 file-name ...
or nroff -T450-12 -h -cm file-name ...
```

or, to increase the line length to 80 characters and decrease the offset to 3 characters:

```
mm -12 -rW80 -rO3 file-name ...
or nroff -T450-12 -rW80 -rO3 -h -cm file-name ...
```

• Hewlett-Packard HP264x CRT family:

```
mm -Thp file-name ... or nroff -cm file-name ... | col | hp
```

Any terminal incapable of reverse paper motion and also lacking hardware tab stops (Texas Instruments 700 series, etc.):

```
mm -T745 file-name ... | col -x
```

• Versatec printer (see vp(1) for additional details):

```
vp [vp-options] "mm -rT2 -c file-name ..."
or vp [vp-options] "nroff -rT2 -cm file-name ... | col"
```

Of course, tbl(1) and eqn(1)/neqn, if needed, must be invoked as shown in the command line prototypes at the beginning of this section.

If two-column processing  $\{12.4\}$  is used with *nroff*, either the -c option must be specified to mm(1), or the *nroff* output must be postprocessed by col(1). In the latter case, the -T37 terminal type must be specified to *nroff*, the -h option must *not* be specified, and the output of col(1) must be processed by the appropriate terminal filter (e.g., 450(1)); mm(1) with the -c option handles all this automatically.

#### 2.4 Parameters that Can Be Set from the Command Line

Number registers are commonly used within MM to hold parameter values that control various aspects of output style. Many of these can be changed within the text files via .nr requests. In addition, some of these registers can be set from the command line itself, a useful feature for those parameters that should not be permanently embedded within the input text itself. If used, these registers (with the possible exception of the register P—see below) must be set on the command line (or before the MM macro definitions are processed) and their meanings are:

-rAn for n = 1 has the effect of invoking the .AF macro without an argument  $\{6.7.2\}$ . If n = 2 allows for usage of the Bell System logo, if available, on a printing device (currently available for the Xerox 9700 only).

<sup>1.</sup> Note that mm(1) uses col(1) automatically for many of the terminal types {2.1}.

- -rCn n sets the type of copy (e.g., DRAFT) to be printed at the bottom of each page. See  $\{9.5\}$ .
  - n = 1 for OFFICIAL FILE COPY.
  - n = 2 for DATE FILE COPY.
  - n = 3 for DRAFT with single-spacing and default paragraph style.
  - n = 4 for DRAFT with double-spacing and 10 space paragraph indent.
- -rDl sets debug mode. This flag requests the formatter to attempt to continue processing even if MM detects errors that would otherwise cause termination. It also includes some debugging information in the default page header {9.2, 12.3}.
- -rEn controls the font of the Subject/Date/From fields. If n is 1 then these fields are bold (default for troff) and if n is 0 then these fields are roman (regular text—default for nroff).
- -rLk sets the length of the physical page to k lines.<sup>2</sup> The default value is 66 lines per page. This parameter is used, for example, when directing output to a Versatec printer.
- -rNn specifies the page numbering style. When n is 0 (default), all pages get the (prevailing) header {9.2}. When n is 1, the page header replaces the footer on page 1 only. When n is 2, the page header is omitted from page 1. When n is 3, "section-page" numbering {4.5} occurs (see .FD {8.3} and .RP {11.4} for footnote and reference numbering in sections). When n is 4, the default page header is suppressed; however a user-specified header is not affected. When n is 5, "section-page" and "section-figure" numbering occurs.

n	Page 1	Pages 2ff.
0	header	header
1	header replaces footer	header
2	no header	header
3	"section-page" as footer	same as page 1
4	no header	no header unless .PH defined
5	same as 3-with "section-figure"	same as page 1

The contents of the prevailing header and footer do not depend on the value of the number register N; N only controls whether and where the header (and, for N=3 or 5, the footer) is printed, as well as the page numbering style. In particular, if the header and footer are null  $\{9.2, 9.5\}$ , the value of N is irrelevant.

- -rOk offsets output k spaces to the right.<sup>2</sup> It is helpful for adjusting output positioning on some terminals. The default offset if this register is not set on the command line is 0.75 inches. NOTE: The register name is the capital letter "O", not the digit zero (0).
- -rPn specifies that the pages of the document are to be numbered starting with n. This register may also be set via a .nr request in the input text.
- -rSn sets the point size and vertical spacing for the document. The default n is 10, i.e., 10-point type on 12-point vertical spacing, giving 6 lines per inch  $\{12.9\}$ . This parameter applies to troff only.
- -rTn provides register settings for certain devices. If n is 1, then the line length and page offset are set to 80 and 3, respectively. Setting n to 2 changes the page length to 84 lines per page and inhibits underlining; it is meant for output sent to the Versatec printer. The default value for n is 0. This parameter applies to nroff only.
- -rU1 controls underlining of section headings. This flag causes only letters and digits to be underlined. Otherwise, all characters (including spaces) are underlined {4.2.2.4.2}. This parameter applies to nroff only.

<sup>2.</sup> For nroff, k is an unscaled number representing lines or character positions; for troff, k must be scaled.

Memorandum Macros 7

-rWk page width (i.e., line length and title length) is set to k.<sup>2</sup> This can be used to change the page width from the default value of 6 inches (60 characters in 10 pitch or 72 characters in 12 pitch).

#### 2.5 Omission of -cm or -mm

If a large number of arguments is required on the command line, it may be convenient to set up the first (or only) input file of a document as follows:

```
zero or more initializations of registers listed in {2.4} .so /usr/lib/tmac/tmac.m remainder of text
```

In this case, one must not use the -cm or -mm flag (nor the mm(1) or mmt(1) command); the .so request has the equivalent effect, but the registers in  $\{2.4\}$  must be initialized before the .so request, because their values are meaningful only if set before the macro definitions are processed. When using this method, it is best to "lock" into the input file only those parameters that are seldom changed. For example:

```
.nr W 80
.nr O 10
.nr N 3
.so /usr/lib/tmac/tmac.m
.H 1 "INTRODUCTION"
:
```

specifies, for nroff, a line length of 80, a page offset of 10, and "section-page" numbering.

## 3. FORMATTING CONCEPTS

#### 3.1 Basic Terms

The normal action of the formatters is to fill output lines from one or more input lines. The output lines may be justified so that both the left and right margins are aligned. As the lines are being filled, words may also be hyphenated  $\{3.4\}$  as necessary. It is possible to turn any of these modes on and off (see .SA  $\{12.2\}$ ,  $Hy\{3.4\}$ , and the formatter .nf and .fi requests [2]). Turning off fill mode also turns off justification and hyphenation.

Certain formatting commands (requests and macros) cause the filling of the current output line to cease, the line (of whatever length) to be printed, and the subsequent text to begin a new output line. This printing of a partially filled output line is known as a *break*. A few formatter requests and most of the MM macros cause a break.

While formatter requests can be used with MM, one must fully understand the consequences and sideeffects that each such request might have. Actually, there is little need to use formatter requests; the macros described here should be used in most cases because:

- it is much easier to control (and change at any later point in time) the overall style of the document.
- complicated features (such as footnotes or tables of contents) can be obtained with ease.
- the user is insulated from the peculiarities of the formatter language.

A good rule is to use formatter requests only when absolutely necessary {3.10}.

In order to make it easy to revise the input text at a later time, input lines should be kept short and should be broken at the end of clauses; each new full sentence must begin on a new line.

#### 3.2 Arguments and Double Quotes

For any macro call, a *null argument* is an argument whose width is zero. Such an argument often has a special meaning; the preferred form for a null argument is "". Note that *omitting* an argument is *not* the same as supplying a *null argument* (for example, see the .MT macro in {6.6}). Furthermore, omitted arguments can occur only at the end of an argument list, while null arguments can occur anywhere.

Any macro argument containing ordinary (paddable) spaces must be enclosed in double quotes (").3 Otherwise, it will be treated as several separate arguments.

Double quotes (") are not permitted as part of the value of a macro argument or of a string that is to be used as a macro argument. If you must, use two grave accents (``) and/or two acute accents ('`) instead. This restriction is necessary because many macro arguments are processed (interpreted) a variable number of times; for example, headings are first printed in the text and may be (re)printed in the table of contents.

## 3.3 Unpaddable Spaces

When output lines are justified to give an even right margin, existing spaces in a line may have additional spaces appended to them. This may harm the desired alignment of text. To avoid this problem, it is necessary to be able to specify a space that cannot be expanded during justification, i.e., an unpaddable space. There are several ways to accomplish this.

First, one may type a backslash followed by a space ("\"). This pair of characters directly generates an unpaddable space. Second, one may sacrifice some seldom-used character to be translated into a space upon output. Because this translation occurs after justification, the chosen character may be used anywhere an unpaddable space is desired. The tilde (") is often used for this purpose. To use it in this way, insert the following at the beginning of the document:

tr '

If a tilde must actually appear in the output, it can be temporarily "recovered" by inserting:

.tr ~

before the place where it is needed. Its previous usage is restored by repeating the ".tr "", but only after a break or after the line containing the tilde has been forced out. Note that the use of the tilde in this fashion is not recommended for documents in which the tilde is used within equations.

## 3.4 Hyphenation

The formatters do not perform hyphenation unless the user requests it. Hyphenation can be turned on in the body of the text by specifying:

.nr Hy 1

once at the beginning of the document. For hyphenation within footnotes and across pages, see [8.3].

If hyphenation is requested, the formatters will automatically hyphenate words, if need be. However, the user may specify the hyphenation points for a specific occurrence of any word by the use of a special character known as a hyphenation indicator, or may specify hyphenation points for a small list of words (about 128 characters).

If the hyphenation indicator (initially, the two-character sequence "\%") appears at the beginning of a word, the word is not hyphenated. Alternatively, it can be used to indicate legal hyphenation point(s) inside a word. In any case, all occurrences of the hyphenation indicator disappear on output.

The user may specify a different hyphenation indicator:

.HC [hyphenation-indicator]

The circumflex (^) is often used for this purpose; this is done by inserting the following at the beginning of a document:

<sup>3.</sup> A double quote (") is a single character that must not be confused with two apostrophes or acute accents (""), or with two grave accents ("").

.HC ^

Note that any word containing hyphens or dashes—also known as em dashes—will be hyphenated immediately after a hyphen or dash if it is necessary to hyphenate the word, even if the formatter hyphenation function is turned off.

The user may supply, via the .hw request, a small list of words with the proper hyphenation points indicated. For example, to indicate the proper hyphenation of the word "printout," one may specify:

.hw print-out

#### 3.5 Tabs

The macros .MT {6.6}, .TC {10.1}, and .CS {10.2} use the formatter .ta request to set tab stops, and then restore the *default* values<sup>4</sup> of tab settings. Thus, setting tabs to other than the default values is the user's responsibility.

Note that a tab character is always interpreted with respect to its position on the *input line*, rather than its position on the output line. In general, tab characters should appear only on lines processed in "no-fill" mode {3.1}.

Also note that tbl(1) {7.3} changes tab stops, but does not restore the default tab settings.

## 3.6 Special Use of the BEL Character

The non-printing character BEL is used as a delimiter in many macros where it is necessary to compute the width of an argument or to delimit arbitrary text, e.g., in headers and footers {9}, headings {4}, and list marks {5}. Users who include BEL characters in their input text (especially in arguments to macros) will receive mangled output.

#### 3.7 Bullets

A bullet (•) is often obtained on a typewriter terminal by using an "o" overstruck by a "+". For compatibility with troff, a bullet string is provided by MM. Rather than overstriking, use the sequence:

\\*(BU

wherever a bullet is desired. Note that the bullet list (.BL) macros {5.3.3.2} use this string to automatically generate the bullets for the list items.

## 3.8 Dashes, Minus Signs, and Hyphens

Troff has distinct graphics for a dash, a minus sign, and a hyphen, while nroff does not. Those who intend to use nroff only may use the minus sign ("-") for all three.

Those who wish mainly to use troff should follow the escape conventions of the NROFF/TROFF User's Manual [2].

Those who want to use both formatters must take care during text preparation. Unfortunately, these characters cannot be represented in a way that is both compatible and convenient. We suggest the following approach:

Dash Type \\*(EM for each text dash for both nroff and troff. This string generates an em dash (-) in troff and " -- " in nroff. Note that the dash list (.DL) macros {5.3.3.3} automatically generate the em dash for each list item.

Hyphen Type "-" and use as is for both formatters. Nroff will print it as is, and troff will print "-" (a true hyphen).

<sup>4.</sup> Every eight characters in nroff; every 1/2 inch in troff.

Minus Type "\-" for a true minus sign, regardless of formatter. Nroff will effectively ignore the "\", while troff will print a true minus sign.

## 3.9 Trademark String

A trademark string \\*(Tm is available with MM. This places the letters "TM" one-half line above the text that it follows.

For example:

The UNIX\\*(Tm User's Manual is available from the library.

yields:

The UNIX<sup>TM</sup> User's Manual is available from the library.

# 3.10 Use of Formatter Requests •

Most formatter requests [2] should not be used with MM because MM provides the corresponding formatting functions in a much more user-oriented and surprise-free fashion than do the basic formatter requests {3.1}. However, some formatter requests are useful with MM, namely:

The .fp, .lg, and .ss requests are also sometimes useful for troff. Use of other requests without fully understanding their implications very often leads to disaster.

#### 4. PARAGRAPHS AND HEADINGS

This section describes simple paragraphs and section headings. Additional paragraph and list styles are covered in {5}.

## 4.1 Paragraphs

.P [type]

one or more lines of text.

This macro is used to begin two kinds of paragraphs. In a left-justified paragraph, the first line begins at the left margin, while in an indented paragraph, it is indented five spaces (see below).

A document possesses a default paragraph style obtained by specifying ".P" before each paragraph that does not follow a heading  $\{4.2\}$ . The default style is controlled by the register Pt. The initial value of Pt is 0, which always provides left-justified paragraphs. All paragraphs can be forced to be indented by inserting the following at the beginning of the document:

All paragraphs will be indented except after headings, lists, and displays if the following:

is inserted at the beginning of the document.

The amount a paragraph is indented is contained in the register Pi, whose default value is 5. To indent paragraphs by, say, 10 spaces, insert:

at the beginning of the document. Of course, both the Pi and Pt register values must be greater than zero for any paragraphs to be indented.

The number register Ps controls the amount of spacing between paragraphs. By default, Ps is set to 1, yielding one blank space ( $\frac{1}{2}$  a vertical space).

Memorandum Macros

Values that specify indentation must be unscaled and are treated as "character positions," i.e., as a number of ens. In troff, an en is the number of points (1 point = 1/72 of an inch) equal to half the current point size. In nroff, an en is equal to the width of a character.

Regardless of the value of *Pt*, an *individual* paragraph can be forced to be left-justified or indented. ".P 0" always forces left justification; ".P 1" always causes indentation by the amount specified by the register *Pi*.

If .P occurs inside a list, the indent (if any) of the paragraph is added to the current list indent {5}.

Numbered paragraphs may be produced by setting the register Np to 1. This produces paragraphs numbered within first level headings, e.g., 1.01, 1.02, 1.03, 2.01, etc.

A different style of numbered paragraphs is obtained by using the

.nP

macro rather than the .P macro for paragraphs. This produces paragraphs that are numbered within second level headings and contain a "double-line indent" in which the text of the second line is indented to be aligned with the text of the first line so that the number stands out.

.H 1 "FIRST HEADING"

.H 2 "Second Heading"

.nP

one or more lines of text

#### 4.2 Numbered Headings

.H level [heading-text] [heading-suffix] zero or more lines of text

The .H macro provides seven levels of numbered headings, as illustrated by this document. Level 1 is the most major or highest; level 7 the lowest.

The heading-suffix is appended to the heading-text and may be used for footnote marks which should not appear with the heading text in the Table of Contents.

- \*\* Strictly speaking, there is no need for a .P macro immediately after a .H (or .HU {4.3}), because the .H macro also performs the function of the .P macro, and an immediately following .P is ignored {4.2.2.2}. It is, however, good practice to start every paragraph with a .P macro, thereby ensuring that all paragraphs uniformly begin with a .P throughout an entire document.
- 4.2.1 Normal Appearance. The normal appearance of headings is as shown in this document. The effect of .H varies according to the level argument. First-level headings are preceded by two blank lines (one vertical space); all others are preceded by one blank line (½ a vertical space).
  - .H 1 heading-text gives a bold heading followed by a single blank line (½ a vertical space). The following text begins on a new line and is indented according to the current paragraph type. Full capital letters should normally be used to make the heading stand out.
- .H 2 heading-text yields a bold heading followed by a single blank line (½ a vertical space). The following text begins on a new line and is indented according to the current paragraph type. Normally, initial capitals are used.
- .H n heading-text for  $3 \le n \le 7$ , produces an underlined (italic) heading followed by two spaces. The following text appears on the same line, i.e., these are run-in headings.

Appropriate numbering and spacing (horizontal and vertical) occur even if the heading text is omitted from a .H macro call.

Here are the first few .H calls of {4}:

- .H 1 "PARAGRAPHS AND HEADINGS"
- .H 2 "Paragraphs"
- .H 2 "Numbered Headings"
- .H 3 "Normal Appearance."
- .H 3 "Altering Appearance of Headings."
- .H 4 "Pre-Spacing and Page Ejection."
- .H 4 "Spacing After Headings."
- .H 4 "Centered Headings."
- .H 4 "Bold, Italic, and Underlined Headings"
- .H 5 "Control by Level."
- 4.2.2 Altering Appearance of Headings. Users satisfied with the default appearance of headings may skip to {4.3}. One can modify the appearance of headings quite easily by setting certain registers and strings at the beginning of the document. This permits quick alteration of a document's style, because this style-control information is concentrated in a few lines, rather than being distributed throughout the document.
- 4.2.2.1 Pre-Spacing and Page Ejection. A first-level heading normally has two blank lines (one vertical space) preceding it, and all others have one blank line (½ a vertical space). If a multi-line heading were to be split across pages, it is automatically moved to the top of the next page. Every first-level heading may be forced to the top of a new page by inserting:

at the beginning of the document. Long documents may be made more manageable if each section starts on a new page. Setting Ej to a higher value causes the same effect for headings up to that level, i.e., a page eject occurs if the heading level is less than or equal to Ej.

4.2.2.2 Spacing After Headings. Three registers control the appearance of text immediately following a .H call. They are Hb (heading break level), Hs (heading space level), and Hi (post-heading indent).

If the heading level is less than or equal to Hb, a break  $\{3.1\}$  occurs after the heading. If the heading level is less than or equal to Hs, a blank line (½ a vertical space) is inserted after the heading. Defaults for Hb and Hs are 2. If a heading level is greater than Hb and also greater than Hs, then the heading (if any) is run into the following text. These registers permit headings to be separated from the text in a consistent way throughout a document, while allowing easy alteration of white space and heading emphasis.

For any stand-alone heading, i.e., a heading not run into the following text, the alignment of the next line of output is controlled by the register Hi. If Hi is 0, text is left-justified. If Hi is 1 (the default value), the text is indented according to the paragraph type as specified by the register Pt {4.1}. Finally, if Hi is 2, text is indented to line up with the first word of the heading itself, so that the heading number stands out more clearly.

For example, to cause a blank line ( $\frac{1}{2}$  a vertical space) to appear after the first three heading levels, to have no run-in headings, and to force the text following all headings to be left-justified (regardless of the value of Pt), the following should appear at the top of the document:

- nr Hs 3
- .nr Hb 7
- .nr Hi 0

4.2.2.3 Centered Headings. The register Hc can be used to obtain centered headings. A heading is centered if its level is less than or equal to Hc, and if it is also stand-alone  $\{4.2.2.2\}$ . Hc is 0 initially (no centered headings).

# 4.2.2.4 Bold, Italic, and Underlined Headings

4.2.2.4.1 Control by Level. Any heading that is underlined by nroff is made italic by troff. The string HF (heading font) contains seven codes that specify the fonts for heading levels 1-7. The legal codes, their interpretations, and the defaults for HF are:

Formatter	HF Code		Default	
	1	2	3	HF
nroff	no underline	underline	bold	3 3 2 2 2 2 2
troff	roman	italic	bold	3322222

Thus, levels 1 and 2 are bold; levels 3 through 7 are underlined in *nroff* and italic in *troff*. The user may reset HF as desired. Any value omitted from the right end of the list is taken to be 1. For example, the following would result in five bold levels and two non-underlined (roman) levels:

# .ds HF 3 3 3 3 3

4.2.2.4.2 Nroff Underlining Style. Nroff can underline in two ways. The normal style (.ul request) is to underline only letters and digits. The continuous style (.cu request) underlines all characters, including spaces. By default, MM attempts to use the continuous style on any heading that is to be underlined and is short enough to fit on a single line. If a heading is to be underlined, but is too long, it is underlined the normal way (i.e., only letters and digits are underlined).

All underlining of headings can be forced to the normal way by using the -rU1 flag when invoking nroff {2.4}.

4.2.2.4.3 Heading Point Sizes. The user may also specify the desired point size for each heading level with the HP string (for use with troff only).

By default, the text of headings (.H and .HU) is printed in the same point size as the body except that bold stand-alone headings are printed in a size one point smaller than the body. The string HP, similar to the string HF, can be specified to contain up to seven values, corresponding to the seven levels of headings. For example:

specifies that the first and second level headings are to be printed in 12-point type, with the remainder printed in 10-point. Note that the specified values may also be relative point-size changes, e.g.:

.ds HP 
$$+2 +2 -1 -1$$

If absolute point sizes are specified, then those sizes will be used regardless of the point size of the body of the document. If relative point sizes are specified, then the point sizes for the headings will be relative to the point size of the body, even if the latter is changed.

Null or zero values imply that the default size will be used for the corresponding heading level.

Only the point size of the headings is affected. Specifying a large point size without providing increased vertical spacing (via .HX and/or .HZ) may cause overprinting.

# 4.2.2.5 Marking Styles - Numerals and Concatenation and during the College and the College and the College and Concatenation and the College and College and Concatenation and the College and the College and Col

The registers named H1 through H7 are used as counters for the seven levels of headings. Their values are normally printed using Arabic numerals. The .HM macro (heading mark style) allows this choice to be overridden, thus providing "outline" and other document styles. This macro can have up to seven arguments; each argument is a string indicating the type of marking to be used. Legal values and their meanings are shown below; omitted values are interpreted as 1, while illegal values have no effect.

Value	Interpretation
1 -	Arabic (default for all levels)
0001	Arabic with enough leading zeroes to get the specified number of digits
Α	Upper-case alphabetic
a	Lower-case alphabetic
I	Upper-case Roman
i	Lower-case Roman

By default, the complete heading mark for a given level is built by concatenating the mark for that level to the right of all marks for all levels of higher value. To inhibit the concatenation of heading level marks, i.e., to obtain just the current level mark followed by a period, set the register *Ht* (heading-mark type) to 1.

For example, a commonly-used "outline" style is obtained by:

.HM I A 1 a i

## 4.3 Unnumbered Headings

.HU heading-text

.HU is a special case of .H; it is handled in the same way as .H, except that no heading mark is printed. In order to preserve the hierarchical structure of headings when .H and .HU calls are intermixed, each .HU heading is considered to exist at the level given by register Hu, whose initial value is 2. Thus, in the normal case, the only difference between:

.HU heading-text

and:

## .H 2 heading-text

is the printing of the heading mark for the latter. Both have the effect of incrementing the numbering counter for level 2, and resetting to zero the counters for levels 3 through 7. Typically, the value of Hu should be set to make unnumbered headings (if any) be the lowest-level headings in a document.

.HU can be especially helpful in setting up appendices and other sections that may not fit well into the numbering scheme of the main body of a document {14.2.1}.

## 4.4 Headings and the Table of Contents

The text of headings and their corresponding page numbers can be automatically collected for a table of contents. This is accomplished by doing the following two things:

- specifying in the register Cl what level headings are to be saved
- invoking the .TC macro {10.1} at the end of the document

Any heading whose level is less than or equal to the value of the register Cl (contents level) is saved and later displayed in the table of contents. The default value for Cl is 2, i.e., the first two levels of headings are saved.

Due to the way the headings are saved, it is possible to exceed the formatter's storage capacity, particularly when saving many levels of many headings, while also processing displays {7} and footnotes {8}. If this happens, the "Out of temp file space" diagnostic {Appendix D} will be issued; the only remedy is to save fewer levels and/or to have fewer words in the heading text.

## 4.5 First-Level Headings and Page Numbering Style

By default, pages are numbered sequentially at the top of the page. For large documents, it may be desirable to use page numbering of the form "section-page," where section is the number of the

15

current first-level heading. This page numbering style can be achieved by specifying the -rN3 or -rN5 flag on the command line  $\{9.9\}$ . As a side effect, this also has the effect of setting Ej to 1, i.e., each section begins on a new page. In this style, the page number is printed at the *bottom* of the page, so that the correct section number is printed.

#### 4.6 User Exit Macros •

This section is intended only for users who are accustomed to writing formatter macros.

.HX dlevel rlevel heading-text

.HY dlevel rlevel heading-text

.HZ dlevel rlevel heading-text

The .HX, .HY, and .HZ macros are the means by which the user obtains a final level of control over the previously-described heading mechanism. MM does not define .HX, .HY, and .HZ; they are intended to be defined by the user. The .H macro invokes .HX shortly before the actual heading text is printed; it calls .HZ as its last action. After .HX is invoked, the size of the heading is calculated. This processing causes certain features that may have been included in .HX, such as .ti for temporary indent, to be lost. After the size calculation, .HY is invoked so that the user may respecify these features. All the default actions occur if these macros are not defined. If the .HX, .HY, or .HZ are defined by the user, the user-supplied definition is interpreted at the appropriate point. These macros can therefore influence the handling of all headings, because the .HU macro is actually a special case of the .H macro.

If the user originally invoked the .H macro, then the derived level (*dlevel*) and the real level (*rlevel*) are both equal to the level given in the .H invocation. If the user originally invoked the .HU macro  $\{4.3\}$ , *dlevel* is equal to the contents of register Hu, and *rlevel* is 0. In both cases, *heading-text* is the text of the original invocation.

By the time .H calls .HX, it has already incremented the heading counter of the specified level {4.2.2.5}, produced blank line(s) (vertical space) to precede the heading {4.2.2.1}, and accumulated the "heading mark", i.e., the string of digits, letters, and periods needed for a numbered heading. When .HX is called, all user-accessible registers and strings can be referenced, as well as the following:

- string \ 0 If rlevel is non-zero, this string contains the "heading mark." Two unpaddable spaces (to separate the mark from the heading) have been appended to this string. If rlevel is 0, this string is null.
- register; 0 This register indicates the type of spacing that is to follow the heading {4.2.2.2}. A value of 0 means that the heading is run-in. A value of 1 means a break (but no blank line) is to follow the heading. A value of 2 means that a blank line (½ a vertical space) is to follow the heading.
- string }2 If register; 0 is 0, this string contains two unpaddable spaces that will be used to separate the (run-in) heading from the following text. If register; 0 is non-zero, this string is null.
- register; 3 This register contains an adjustment factor for a .ne request issued before the heading is actually printed. On entry to .HX, it has the value 3 if *dlevel* equals 1, and 1 otherwise. The .ne request is for the following number of lines: the contents of the register; 0 taken as blank lines (halves of vertical space) plus the contents of register; 3 as blank lines (halves of vertical space) plus the number of lines of the heading.

The user may alter the values of  $\{0, \}2$ , and  $\{3, \}3$  within .HX as desired. The following are examples of actions that might be performed by defining .HX to include the lines shown:

Change first-level heading mark from format n. to n.0: if  $\S 1 = 1$  .ds  $\S 0 \ \$ 

( stands for a space)

Separate run-in heading from the text with a period and two unpaddable spaces:

.if 
$$\n(;0=0 .ds \}2 . \square \square$$

Assure that at least 15 lines are left on the page before printing a first-level heading:  $\inf \sl = 1 \cdot nr \ ; 3 \cdot 15 - \n(; 0)$ 

Add 3 additional blank lines before each first-level heading:

.if 
$$\$$
1=1 .sp 3

Indent level 3 run-in headings by 5 spaces:

.if 
$$\$$
1 = 3 .ti 5n

If temporary strings or macros are used within .HX, chose their names with care {14.1}.

.HY is called after the .ne is issued. Certain features requested in .HX must be repeated. For example:

```
.de HY .if \1=3 .ti 5n
```

.HZ is called at the end of .H to permit user-controlled actions after the heading is produced. For example, in a large document, sections may correspond to chapters of a book, and the user may want to change a page header or footer, e.g.:

```
.de HZ .if \1=1 .PF "^Section \3^"
```

#### 4.7 Hints for Large Documents

A large document is often organized for convenience into one file per section. If the files are numbered, it is wise to use enough digits in the names of these files for the maximum number of sections, i.e., use suffix numbers 01 through 20 rather than 1 through 9 and 10 through 20.

Users often want to format individual sections of long documents. To do this with the correct section numbers, it is necessary to set register H1 to 1 less than the number of the section just before the corresponding ".H 1" call. For example, at the beginning of section 5, insert:

```
.nr H1 4
```

This is a dangerous practice: it defeats the automatic (re)numbering of sections when sections are added or deleted. Remove such lines as soon as possible.

#### 5. LISTS

This section describes many different kinds of lists: automatically-numbered and alphabetized lists, bullet lists, dash lists, lists with arbitrary marks, and lists starting with arbitrary strings, e.g., with terms or phrases to be defined.

## 5.1 Basic Approach

In order to avoid repetitive typing of arguments to describe the appearance of items in a list, MM provides a convenient way to specify lists. All lists are composed of the following parts:

- A list-initialization macro that controls the appearance of the list: line spacing, indentation, marking
  with special symbols, and numbering or alphabetizing.
- One or more List Item (.LI) macros, each followed by the actual text of the corresponding list item.

• The List End (.LE) macro that terminates the list and restores the previous indentation.

Lists may be nested up to six levels. The list-initialization macro saves the previous list status (indentation, marking style, etc.); the .LE macro restores it.

With this approach, the format of a list is specified only once at the beginning of that list. In addition, by building on the existing structure, users may create their own customized sets of list macros with relatively little effort {5.4, Appendix A}.

## 5.2 Sample Nested Lists

The input for several lists and the corresponding output are shown below. The .AL and .DL macro calls {5.3.3} contained therein are examples of the *list-initialization* macros. This example will help us to explain the material in the following sections. Input text:

AL A

.LI

This is an alphabetized item.

This text shows the alignment of the second line of the item.

The quick brown fox jumped over the lazy dog's back.

.AL

.LI

This is a numbered item.

This text shows the alignment of the second line of the item.

The quick brown fox jumped over the lazy dog's back.

.DL

.LI

This is a dash item.

This text shows the alignment of the second line of the item.

The quick brown fox jumped over the lazy dog's back.

.LI + 1

This is a dash item with a "plus" as prefix.

This text shows the alignment of the second line of the item.

The quick brown fox jumped over the lazy dog's back.

.LE

.LI

This is numbered item 2.

.LE

.LI

This is another alphabetized item, B.

This text shows the alignment of the second line of the item.

The quick brown fox jumped over the lazy dog's back.

.LE

.P

This paragraph appears at the left margin.

# Output:

- A. This is an alphabetized item. This text shows the alignment of the second line of the item. The quick brown fox jumped over the lazy dog's back.
  - 1. This is a numbered item. This text shows the alignment of the second line of the item. The quick brown fox jumped over the lazy dog's back.
    - This is a dash item. This text shows the alignment of the second line of the item. The quick brown fox jumped over the lazy dog's back.
    - + This is a dash item with a "plus" as prefix. This text shows the alignment of the second line of the item. The quick brown fox jumped over the lazy dog's back.
  - 2. This is numbered item 2.
- B. This is another alphabetized item, B. This text shows the alignment of the second line of the item. The quick brown fox jumped over the lazy dog's back.

This paragraph appears at the left margin.

#### 5.3 Basic List Macros

Because all lists share the same overall structure except for the list-initialization macro, we first discuss the macros common to all lists. Each list-initialization macro is covered in {5.3.3}.

#### 5.3.1 List Item

.LI [mark] [1]

one or more lines of text that make up the list item.

The .LI macro is used with all lists. It normally causes the output of a single blank line ( $\frac{1}{2}$  a vertical space) before its item, although this may be suppressed. If no arguments are given, it labels its item with the *current mark*, which is specified by the most recent list-initialization macro. If a single argument is given to .LI, that argument is output *instead of* the current mark. If two arguments are given, the first argument becomes a *prefix* to the current mark, thus allowing the user to emphasize one or more items in a list. One unpaddable space is inserted between the prefix and the mark. For example:

.BL 6
.LI
This is a simple bullet item.
.LI +
This replaces the bullet with a 'plus.'
.LI + 1
But this uses 'plus' as prefix to the bullet.
.LE

#### vields:

- This is a simple bullet item.
- + This replaces the bullet with a "plus."
- + But this uses "plus" as prefix to the bullet.
- The mark must not contain ordinary (paddable) spaces, because alignment of items will be lost if the right margin is justified {3.3}.

If the current mark (in the current list) is a null string, and the first argument of .LI is omitted or null, the resulting effect is that of a hanging indent, i.e., the first line of the following text is "outdented," starting at the same place where the mark would have started {5.3.3.6}.

Memorandum Macros

19

#### 5.3.2 List End

#### .LE [1]

List End restores the state of the list back to that existing just before the most recent list-initialization macro call. If the optional argument is given, the .LE outputs a blank line (½ a vertical space). This option should generally be used only when the .LE is followed by running text, but not when followed by a macro that produces blank lines of its own, such as .P. .H, or .LI.

.H and .HU automatically clear all list information, so one may legally omit the .LE(s) that would normally occur just before either of these macros. Such a practice is *not* recommended, however, because errors will occur if the list text is separated from the heading at some later time (e.g., by insertion of text).

5.3.3 List Initialization Macros. The following are the various list-initialization macros. They are actually implemented as calls to the more basic .LB macro {5.4}.

## 5.3.3.1 Automatically-Numbered or Alphabetized Lists

# .AL [type] [text-indent] [1]

The .AL macro is used to begin sequentially-numbered or alphabetized lists. If there are no arguments, the list is numbered, and text is indented Li, initially 6 (5)<sup>5</sup> spaces from the indent in force when the .AL is called, thus leaving room for a space, two digits, a period, and two spaces before the text.

Spacing at the beginning of the list and between the items can be suppressed by setting the Ls (list space) register. Ls is set to the innermost list level for which spacing is done. For example:

#### .nr Ls 0

specifies that no spacing will occur around any list items. The default value for Ls is 6 (which is the maximum list nesting level).

The type argument may be given to obtain a different type of sequencing, and its value should indicate the first element in the sequence desired, i.e., it must be 1, A, a, I, or i {4.2.2.5}.<sup>6</sup> If type is omitted or null, then "1" is assumed. If text-indent is non-null, it is used as the number of spaces from the current indent to the text, i.e., it is used instead of Li for this list only. If text-indent is null, then the value of Li will be used.

If the third argument is given, a blank line (½ a vertical space) will not separate the items in the list. A blank line (½ a vertical space) will occur before the first item, however.

#### 5.3.3.2 Bullet List

## .BL [text-indent] [1]

.BL begins a bullet list, in which each item is marked by a bullet (•) followed by one space. If text-indent is non-null, it overrides the default indentation—the amount of paragraph indentation as given in the register Pi {4.1}.

If a second argument is specified, no blank lines will separate the items in the list.

<sup>5.</sup> Values that specify indentation must be unscaled and are treated as "character positions," i.e., as the number of ens.

<sup>6.</sup> Note that the "0001" format is not permitted.

<sup>7.</sup> So that, in the default case, the text of bullet and dash lists lines up with the first line of indented paragraphs.

## 5.3.3.3 Dash List

.DL [text-indent] [1]

.DL is identical to .BL, except that a dash is used instead of a bullet.

#### 5.3.3.4 Marked List

.ML mark [text-indent] [1]

.ML is much like .BL and .DL, but expects the user to specify an arbitrary mark, which may consist of more than a single character. Text is indented text-indent spaces if the second argument is not null; otherwise, the text is indented one more space than the width of mark. If the third argument is specified, no blank lines will separate the items in the list.

The mark must not contain ordinary (paddable) spaces, because alignment of items will be lost if the right margin is justified {3.3}.

# 5.3.3.5 Reference List

.RL [text-indent] [1]

A .RL call begins an automatically-numbered list in which the numbers are enclosed by square brackets ([]). Text-indent may be supplied, as for .AL. If omitted or null, it is assumed to be 6, a convenient value for lists numbered up to 99. If the second argument is specified, no blank lines will separate the items in the list.

#### 5.3.3.6 Variable-Item List

.VL text-indent [mark-indent] [1]

When a list begins with a .VL, there is effectively no current mark; it is expected that each .LI will provide its own mark. This form is typically used to display definitions of terms or phrases. Mark-indent gives the number of spaces from the current indent to the beginning of the mark, and it defaults to 0 if omitted or null. Text-indent gives the distance from the current indent to the beginning of the text. If the third argument is specified, no blank lines will separate the items in the list. Here is an example of .VL usage:

.tr ~ .VL 20 2 .LI mark 1

Here is a description of mark 1;

mark 1 of the .LI line contains a tilde translated to an unpaddable space in order to avoid extra spaces between

"mark" and "1" {3.3}.

.LI second mark

This is the second mark, also using a tilde translated to an unpaddable space.

.LI third mark longer than indent:

This item shows the effect of a long mark; one space separates the mark

from the text.

.LI ~

This item effectively has no mark because the tilde following the .LI is translated into a space.

.LE

yields:

mark 1

Here is a description of mark 1; "mark 1" of the .LI line contains a tilde translated to an unpaddable space in order to avoid extra spaces between "mark" and "1" {3.3}.

second mark

This is the second mark, also using a tilde translated to an unpaddable space.

third mark longer than indent: This item shows the effect of a long mark; one space separates the mark from the text.

This item effectively has no mark because the tilde following the .LI is translated into a space.

The tilde argument on the last .LI above is required; otherwise a hanging indent would have been produced. A hanging indent is produced by using .VL and calling .LI with no arguments or with a null first argument. For example:

.VL 10

.LI

Here is some text to show a hanging indent.

The first line of text is at the left margin.

The second is indented 10 spaces.

.LE

yields:

Here is some text to show a hanging indent. The first line of text is at the left margin. The second is indented 10 spaces.

The mark must not contain ordinary (paddable) spaces, because alignment of items will be lost if the right margin is justified {3.3}.

#### 5.4 List-Begin Macro and Customized Lists •

.LB text-indent mark-indent pad type [mark] [LI-space] [LB-space]

The list-initialization macros described above suffice for almost all cases. However, if necessary, one may obtain more control over the layout of lists by using the basic list-begin macro. LB, which is also used by all the other list-initialization macros. Its arguments are as follows:

Text-indent gives the number of spaces that the text is to be indented from the current indent. Normally, this value is taken from the register Li for automatic lists and from the register Pi for bullet and dash lists.

The combination of mark-indent and pad determines the placement of the mark. The mark is placed within an area (called mark area) that starts mark-indent spaces to the right of the current indent, and ends where the text begins (i.e., ends text-indent spaces to the right of the current indent). Within the mark area, the mark is left-justified if pad is 0. If pad is greater than 0, say n, then n blanks are appended to the mark; the mark-indent value is ignored. The resulting string immediately precedes the text. That is, the mark is effectively right-justified pad spaces immediately to the left of the text.

Type and mark interact to control the type of marking used. If type is 0, simple marking is performed using the mark character(s) found in the mark argument. If type is greater than 0, automatic numbering or alphabetizing is done, and mark is then interpreted as the first item in the sequence to be used for numbering or alphabetizing, i.e., it is chosen from the set (1, A, a, I, i) as in {5.3.3.1}. That is:

<sup>8.</sup> The mark-indent argument is typically 0.

Type	Mark	Result
0	omitted	hanging indent
0	string	string is the mark
>0	omitted	arabic numbering
>0	one of:	automatic numbering or
	1, A, a, I, i	alphabetic sequencing

Each non-zero value of type from 1 to 6 selects a different way of displaying the marks. The following table shows the output appearance for each value of type:

Туре	Appearance
1	х.
2	x)
3	(x)
4	[x]
5	<x></x>
6	{x}

where x is the generated number or letter.

The mark must not contain ordinary (paddable) spaces, because alignment of items will be lost if the right margin is justified {3.3}.

LI-space gives the number of blank lines (halves of a vertical space) that should be output by each .LI macro in the list. If omitted, LI-space defaults to 1; the value 0 can be used to obtain compact lists. If LI-space is greater than 0, the .LI macro issues a .ne request for two lines just before printing the mark.

LB-space, the number of blank lines (½ a vertical space) to be output by .LB itself, defaults to 0 if omitted.

There are three reasonable combinations of *LI-space* and *LB-space*. The normal case is to set *LI-space* to 1 and *LB-space* to 0, yielding one blank line before each item in the list; such a list is usually terminated with a ".LE 1" to end the list with a blank line. In the second case, for a more compact list, set *LI-space* to 0 and *LB-space* to 1, and, again, use ".LE 1" at the end of the list. The result is a list with one blank line before and after it. If you set both *LI-space* and *LB-space* to 0, and use ".LE" to end the list, a list without any blank lines will result.

Appendix A shows how one can build upon the supplied list macros to obtain other kinds of lists.

## 6. MEMORANDUM AND RELEASED PAPER STYLES

One use of MM is for the preparation of memoranda and released papers, which have special requirements for the first page and for the cover sheet. The information needed for the memorandum or released paper (title, author, date, case numbers, etc.) is entered in the same way for both styles; an argument to one macro indicates which style is being used. The following sections describe the macros used to provide this data. The required order is shown in  $\{6.9\}$ .

If neither the memorandum nor released-paper style is desired, the macros described below should be omitted from the input text. If these macros are omitted, the first page will simply have the page header {9} followed by the body of the document.

#### 6.1 Title

.TL [charging-case] [filing-case] one or more lines of title text

Memorandum Macros 23

The arguments to the .TL macro are the charging case number(s) and filing case number(s). The title of the memorandum or paper follows the .TL macro and is processed in fill mode {3.1}. Multiple charging case numbers are entered as "sub-arguments" by separating each from the previous with a comma and a space, and enclosing the *entire* argument within double quotes. Multiple filing case numbers are entered similarly. For example:

.TL "12345, 67890" 987654321

On the Construction of a Table of All Even Prime Numbers

The .br request may be used to break the title on output into several lines as follows:

.TL 12345 First Title Line .br \!.br

Second Title Line

On output, the title appears after the word "subject" in the memorandum style. In the released-paper style, the title is centered and bold.

If only a charging case number or only a filing case number is given, then it will be separated from the title in the memorandum style by a dash and will appear on the same line as the title. If both case numbers are given and are the same, then "Charging and Filing Case" followed by the number will appear on a line following the title. If the two case numbers are different, then separate lines for "Charging Case" and "File Case" will appear after the title.

#### 6.2 Author(s)

.AU name [initials] [loc] [dept] [ext] [room] [arg] [arg] [arg] .AT [title] ...

The .AU macro receives as arguments information that describes an author. If any argument contains blanks, it must be enclosed within double quotes. The first six arguments must appear in the order given (a separate .AU macro is required for each author).

The .AT macro is used to specify the author's title. Up to nine arguments may be given. Each will appear in the Signature Block for memorandum style {6.11.1} on a separate line following the signer's name. The .AT must immediately follow the .AU for the given author. For example:

.AU "J. J. Jones" JJJ PY 9876 5432 1Z-234 .AT Director "Materials Research Laboratory"

In the "from" portion in the memorandum style, the author's name is followed by location and department number on one line and by room number and extension number on the next. The "x" for the extension is added automatically. The printing of the location, department number, extension number, and room number may be suppressed on the first page of a memorandum by setting the register Au to 0; the default value for Au is 1. Arguments 7 through 9 of the .AU macro, if present, will follow this "normal" author information in the "from" portion, each on a separate line. These last three arguments may be used for organizational numbering schemes, etc. For example:

#### .AU "S. P. Lename" SPL IH 9988 7766 5H-444 9876-543210.01MF

The name, initials, location, and department are also used in the Signature Block {6.11.1}. The author information in the "from" portion, as well as the names and initials in the Signature Block will appear in the same order as the .AU macros.

The "charging case" is the case number to which time was charged for the development of the project described in the memorandum. The "filing case" is a number under which the memorandum is to be filed.

The names of the authors in the released-paper style are centered below the title. After the name of the last author, "Bell Laboratories" and the location are centered. For the case of authors from different locations, see {6.8}.

## 6.3 TM Number(s)

.TM [number] ...

If the memorandum is a Technical Memorandum, the TM numbers are supplied via the .TM macro. Up to nine numbers may be specified. Example:

.TM 7654321 77777777

This macro call is ignored in the released-paper and external-letter styles {6.6}.

#### 6.4 Abstract

.AS [arg] [indent] text of the abstract

The .AS (abstract start) and .AE (abstract end) macros bracket the (optional) abstract. Abstracts are printed on page 1 of a document and/or on its cover sheet.<sup>10</sup>

In a released paper (first argument of the .MT macro is 4; see {6.6}) and in a Technical Memorandum, if the first argument of .AS is 0, the abstract will be printed on page 1 and on the cover sheet (if any); if the first argument of .AS is 1, the abstract will appear only on the cover sheet (if any).

In Memoranda for File and in all other documents (other than external letters), if the first argument of .AS is 0, the abstract will appear on page 1 and there will be no cover sheet printed; if the first argument of .AS is 2, the abstract will appear only on the cover sheet, which will be produced automatically in this case (i.e., without invoking the .CS macro). It is not possible to get either an abstract or a cover sheet with an external letter (first argument of the .MT macro is 5).

Notations {6.11.2} such as a "copy to" list are allowed on Memorandum for File cover sheets; the .NS and .NE macros must appear after the .AS 2 and .AE. Headings {4.2, 4.3} and displays {7} are not permitted within an abstract.

The abstract is printed with ordinary text margins; an indentation to be used for both margins can be specified as the second argument of .AS.<sup>11</sup>

# 6.5 Other Keywords

.OK [keyword] ...

Topical keywords should be specified on a Technical Memorandum cover sheet. Up to nine such keywords or keyword phrases may be specified as arguments to the .OK macro; if any keyword contains spaces, it must be enclosed within double quotes.

# 6.6 Memorandum Types

.MT [type] [addressee]

The .MT macro controls the format of the top part of the first page of a memorandum or of a released paper, as well as the format of the cover sheets. Legal codes for type and the corresponding values are:

<sup>10.</sup> There are three styles of cover sheet: released paper, Technical Memorandum, and Memorandum for File {10.2}; the last one of these is also used for Engineer's Notes, Memoranda for Record, etc. Cover sheets for released papers and Technical Memoranda are obtained by invoking the .CS macro {10.2}.

<sup>11.</sup> Values that specify indentation must be unscaled and are treated as "character positions," i.e., as the number of ens.

Code	Value
11 11	no memorandum type printed
0	no memorandum type printed
none	MEMORANDUM FOR FILE
1	MEMORANDUM FOR FILE
2	PROGRAMMER'S NOTES
3	ENGINEER'S NOTES
4	released-paper style
5	external-letter style
"string"	string

If type indicates a memorandum style, then value will be printed after the last line of author information. If type is longer than one character, then the string, itself, will be printed. For example:

.MT "Technical Note #5"

A simple letter is produced by calling .MT with a null (but not omitted!) or zero argument.

The second argument to .MT is the name of the addressee of a letter; if present, that name and the page number replace the normal page header on the second and following pages of a letter:

.MT 1 "John Jones"

produces

John Jones - 2

This second argument may not be used for this purpose if the first argument is 4 (i.e., for the released-paper style) as explained in {6.8}.

In the external-letter style (.MT 5), only the title (without the word "subject:") and the date are printed in the upper left and right corners, respectively, on the first page. It is expected that preprinted stationery will be used, providing the author's company logo and address.

## 6.7 Date and Format Changes

6.7.1 Changing the Date. By default, the current date appears in the "date" part of a memorandum. This can be overridden by using:

.ND new-date

The .ND macro alters the value of the string DT, which is initially set to the current date.

6.7.2 Alternate First-Page Format. One can specify that the words "subject," "date," and "from" (in the memorandum style) be omitted and that an alternate company name be used:

.AF [company-name]

If an argument is given, it replaces "Bell Laboratories", without affecting the other headings. If the argument is null, "Bell Laboratories" is suppressed; in this case, extra blank lines are inserted to allow room for stamping the document with a Bell System logo or a Bell Laboratories stamp. AF with no argument suppresses "Bell Laboratories" and the "Subject/Date/From" headings, thus allowing output on preprinted stationery. The use of .AF with no arguments is equivalent to the use of -rA1 {2.4}, except that the latter must be used if it is necessary to change the line length and/or page offset (which default to 5.8i and 1i, respectively, for preprinted forms). The command line options -rOk and -rWk {2.4} are not effective with .AF. The only .AF use appropriate for troff is to specify a replacement for "Bell Laboratories".

The command line option -rEn {2.4} controls the font of the "Subject/Date/From" block.

# 6.8 Released-Paper Style

The released-paper style is obtained by specifying:

.MT 4 [1]

This results in a centered, bold title followed by centered names of authors. The location of the last author is used as the location following "Bell Laboratories" (unless .AF {6.7.2} specifies a different company). If the optional second argument to .MT 4 is given, then the name of each author is followed by the respective company name and location.

Information necessary for the memorandum style but not for the released-paper style is ignored.

If the released-paper style is utilized, most BTL location codes<sup>12</sup> are defined as strings that are the addresses of the corresponding BTL locations. These codes are needed only until the .MT macro is invoked. Thus, following the .MT macro, the user may re-use these string names. In addition, the macros described in {6.11} and their associated lines of input are ignored when the released-paper style is specified.

Authors from non-BTL locations may include their affiliations in the released-paper style by specifying the appropriate .AF and defining a string (with a 2 character name such as XX) for the address before each .AU. For example:

.TL
A Learned Treatise
.AF "Getem Inc."
.ds XX "22 Maple Avenue, Sometown 09999"
.AU "F. Swatter" "" XX
.AF "Bell Laboratories"
.AU "Sam P. Lename" "" CB
.MT 4 1

# 6.9 Order of Invocation of "Beginning" Macros

The macros described in {6.1-6.7}, if present, must be given in the following order:

.ND new-date
.TL [charging-case] [filing-case]
one or more lines of text
.AF [company-name]
.AU name [initials] [loc] [dept] [ext] [room] [arg] [arg] [arg]
.AT [title] ...
.TM [number] ...
.AS [arg] [indent]
one or more lines of text
.AE
.NS [arg]
one or more lines of text
.NE
.OK [keyword] ...
.MT [type] [addressee]

The only required macros for a memorandum or a released paper are .TL, .AU, and .MT; all the others (and their associated input lines) may be omitted if the features they provide are not needed. Once

<sup>12.</sup> Currently, the complete list is: AK, AL, ALF, CB, CH, CP, DR, FJ, HL, HO, HOH, HP, IH, IN, INH, IW, MH, MV, PY, RD, RR, WB, WH, and WV.

.MT has been invoked, none of the above macros (except .NS and .NE) can be re-invoked because they are removed from the table of defined macros to save space.

## 6.10 Example

.MT 4

The input text for this manual begins as follows:

.TL

MM\\*(EMMemorandum Macros
.AU "D. W. Smith" DWS PY
.AU "J. R. Mashey" JRM PY
.AU "E. C. Pariser (January 1980 Revision)" ECP PY
.AU "N. W. Smith (June 1980 Revision)" NWS PY

Appendix C shows the input and both nroff and troff outputs for a simple letter.

#### 6.11 Macros for the End of a Memorandum

At the end of a memorandum (but *not* of a released paper), the signatures of the authors and a list of notations<sup>13</sup> can be requested. The following macros and their input are ignored if the released-paper style is selected.

6.11.1 Signature Block

.FC [closing]
.SG [arg] [1]

.FC prints "Yours very truly," as a formal closing. It must be given before the .SG which prints the signer's name. A different closing may be specified as an argument to .FC.

.SG prints the author name(s) after the formal closing, if any. Each name begins at the center of the page. Three blank lines are left above each name for the actual signature. If no arguments are given, the line of reference data<sup>14</sup> will *not* appear. A non-null first argument is treated as the typist's initials, and is appended to the reference data. Supply a null first argument to print the reference data with neither the typist's initials nor the preceding hyphen.

If there are several authors and if the second argument is given, then the reference data is placed on the same line as the name of the first, rather than last, author.

The reference data contains only the location and department number of the first author. Thus, if there are authors from different departments and/or from different locations, the reference data should be supplied manually after the invocation (without arguments) of the .SG macro. For example:

.SG .rs .sp -1v PY/MH-9876/5432-JJJ/SPL-cen 6.11.2 "Copy to" and Other Notations

.NS [arg]
zero or more lines of the notation
.NE

<sup>13.</sup> See the BTL Office Guide [9], pp. 1.12-16.

<sup>14.</sup> The following information is known as reference data: location code, department number, author's initials, and typist's initials, all separated by hyphens. See the BTL Office Guide [9], page 1.11.

After the signature and reference data, many types of notations may follow, such as a list of attachments or "copy to" lists. The various notations are obtained through the .NS macro, which provides for the proper spacing and for breaking the notations across pages, if necessary.

The codes for arg and the corresponding notations are:

Code	Notations
none	Copy to
N N	Copy to
0	Copy to
1	Copy (with att.) to
2	Copy (without att.) to
3	Att.
4	Atts.
5	Enc.
6	Encs.
7	Under Separate Cover
8	Letter to
9	Memorandum to
"string"	Copy (string) to

If arg consists of more than one character, it is placed within parentheses between the words "Copy" and "to." For example:

.NS "with att. 1 only"

will generate "Copy (with att. 1 only) to" as the notation. More than one notation may be specified before the .NE occurs, because a .NS macro terminates the preceding notation, if any. For example:

.NS 4

Attachment 1-List of register names

Attachment 2-List of string and macro names

.NS 1

J. J. Jones

.NS 2

S. P. Lename

G. H. Hurtz

.NE

would be formatted as:

Atts.

Attachment 1-List of register names

Attachment 2-List of string and macro names

Copy (with att.) to

J. J. Jones

Copy (without att.) to

S. P. Lename

G. H. Hurtz

The .NS and .NE macros may also be used at the beginning following .AS 2 and .AE to place the notation list on the Memorandum for File cover sheet {6.4}. If notations are given at the beginning without .AS 2, they will be saved and output at the end of the document.

eath and the inn of the normal are altered the the trible exists

## 6.11.3 Approval Signature Line

.AV approver's-name

Memorandum Macros 29

The .AV macro may be used after the last notation block to automatically generate a line with spaces for the approval signature and date. For example,

.AV "Jane Doe"

produces:

APPROVED:

Jane Doe Date

## 6.12 Forcing a One-Page Letter

At times, one would like just a bit more space on the page, forcing the signature or items within notations onto the bottom of the page, so that the letter or memo is just one page in length. This can be accomplished by increasing the page length through the -rLn option, e.g. -rL90. This has the effect of making the formatter believe that the page is 90 lines long and therefore giving it more room than usual to place the signature or the notations. This will *only* work for a *single-page* letter or memo.

#### 7. DISPLAYS

Displays are blocks of text that are to be kept together—not split across pages. MM provides two styles of displays: 15 a static (.DS) style and a floating (.DF) style. In the static style, the display appears in the same relative position in the output text as it does in the input text; this may result in extra white space at the bottom of the page if the display is too big to fit there. In the floating style, the display "floats" through the input text to the top of the next page if there is not enough room for it on the current page; thus the input text that follows a floating display may precede it in the output text. A queue of floating displays is maintained so that their relative order is not disturbed.

By default, a display is processed in no-fill mode, with single-spacing, and is *not* indented from the existing margins. The user can specify indentation or centering, as well as fill-mode processing.

Displays and footnotes {8} may never be nested, in any combination whatsoever. Although lists {5} and paragraphs {4.1} are permitted, no headings (.H or .HU) {4.2, 4.3} can occur within displays or footnotes.

#### 7.1 Static Displays

.DS [format] [fill] [rindent] one or more lines of text .DE

A static display is started by the .DS macro and terminated by the .DE macro. With no arguments, .DS will accept the lines of text exactly as they are typed (no-fill mode) and will not indent them from the prevailing left margin indentation or from the right margin. The rindent argument is the number of characters 16 that the line length should be decreased, i.e., an indentation from the right margin.

The format argument to .DS is an integer or letter used to control the left margin indentation and centering with the following meanings:

<sup>15.</sup> Displays are processed in an environment that is different from that of the body of the text (see the .ev request<sup>[2]</sup>).

<sup>16.</sup> This number must be unscaled in nroff and is treated as ens. It may be scaled in troff or else defaults to ems.

Format	Meaning
пп	no indent
0 or L	no indent
1 or I	indent by standard amount
2 or C	center each line
3 or CB	center as a block

The fill argument is also an integer or letter and can have the following meanings:

Fill	Meaning
пп	no-fill mode
0 or N	no-fill mode
1 or F	fill mode

Omitted arguments are taken to be zero.

The standard amount of indentation is taken from the register Si, which is initially 5. Thus, by default, the text of an indented display aligns with the first line of indented paragraphs, whose indent is contained in the Pi register  $\{4.1\}$ . Even though their initial values are the same, these two registers are independent of one another.

The display format value 3 (CB) centers the *entire display* as a block (as opposed to .DS 2 and .DF 2, which center each line *individually*). That is, all the collected lines are left-justified, and then the display is centered, based on the width of the longest line. This format *must* be used in order for the *eqn/neqn* "mark" and "lineup" feature to work with centered equations (see section 7.4 below).

By default, a blank line (½ a vertical space) is placed before and after static and floating displays. These blank lines before and after static displays can be inhibited by setting the register Ds to 0.

The following example shows the usage of all three arguments for displays. This block of text will be filled and indented 5 spaces from both the left and the right margins (i.e., centered).

.DS. IF 5

"We the people of the United States, in order to form a more perfect union, establish justice, ensure domestic tranquility, provide for the common defense, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution to the United States of America."

.DE

#### 7.2 Floating Displays

.DF [format] [fill] [rindent] one or more lines of text .DE

A floating display is started by the .DF macro and terminated by the .DE macro. The arguments have the same meanings as for .DS {7.1}, except that, for floating displays, indent, no indent, and centering are always calculated with respect to the initial left margin, because the prevailing indent may change between the time when the formatter first reads the floating display and the time that the display is printed. One blank line (½ a vertical space) always occurs both before and after a floating display.

The user may exercise great control over the output positioning of floating displays through the use of two number registers, De and Df. When a floating display is encountered by nroff or troff, it is processed and placed onto a queue of displays waiting to be output. Displays are always removed from the queue and printed in the order that they were entered on the queue, which is the order that they appeared in the input file. If a new floating display is encountered and the queue of displays is empty, then the new display is a candidate for immediate output on the current page. Immediate output is governed by the size of the display and the setting of the Df register (see below). The De register (see

Memorandum Macros

31

below) controls whether or not text will appear on the current page after a floating display has been produced.

As long as the queue contains one or more displays, new displays will be automatically entered there, rather than being output. When a new page is started (or the top of the second column when in two-column mode) the next display from the queue becomes a candidate for output if the *Df* register has specified "top-of-page" output. When a display is output it is also removed from the queue.

When the end of a section (when using section-page numbering) or the end of a document is reached, all displays are automatically removed from the queue and output. This will occur before a .SG, .CS, or .TC is processed.

A display is said to "fit on the current page" if there is enough room to contain the entire display on the page, or if the display is longer than one page in length and less than half of the current page has been used. Also note that a wide (full page width) display will never fit in the second column of a two-column document.

The registers, their settings, and their effects are as follows:

De	Action
0	DEFAULT: No special action occurs.
1	A page eject will always follow the output of each floating display, so only one floating display will appear on a page and no text will follow it.
	NOTE: For any other value, the action performed is the same as for the value 1.

Df	Action
0	Floating displays will not be output until end of section (when section- page numbering) or end of document.
1	Output the new floating display on the current page if there is room, otherwise hold it until the end of the section or document.
2	Output exactly one floating display from the queue at the top of a new page or column (when in two-column mode).
3	Output one floating display on current page if there is room. Output exactly one floating display at the top of a new page or column.
4	Output as many displays as will fit (at least one), starting at the top of a new page or column. Note that if register <i>De</i> is set to 1, each display will be followed by a page eject, causing a new top of page to be reached where at least one more display will be output. (This also applies to value 5, below.)
5	DEFAULT: Output a new floating display on the current page if there is room. Output at least one, but as many displays as will fit starting at the top of a new page or column.
	NOTE: For any value greater than 5, the action performed is the same as for the value 5.

The .WC macro {12.4} may also be used to control handling of displays in double-column mode and to control the break in the text before floating displays.

#### 7.3 Tables

.TS [H] global options; column descriptors. title lines [.TH [N]] data within the table.

The .TS (table start) and .TE (table end) macros make possible the use of the tbl(1) processor<sup>[7]</sup>. They are used to delimit the text to be examined by tbl(1) as well as to set proper spacing around the table. The display function and the tbl(1) delimiting function are independent of one another, however, so in order to permit one to keep together blocks that contain any mixture of tables, equations, filled and unfilled text, and caption lines the .TS/.TE block should be enclosed within a display (.DS/.DE). Floating tables may be enclosed inside floating displays (.DF/.DE).

The macros .TS and .TE also permit the processing of tables that extend over several pages. If a table heading is needed for each page of a multi-page table, specify the argument "H" to the .TS macro as above. Following the options and format information, the table heading is typed on as many lines as required and followed by the .TH macro. The .TH macro must occur when ".TS H" is used. Note that this is not a feature of tbl(1), but of the macro definitions provided by MM.

The table header macro .TH may take as an argument the letter N. This argument causes the table header to be printed only if it is the first table header on the page. This option is used when it is necessary to build long tables from smaller .TS H/.TE segments. For example:

.TS H
global options;
column descriptors.
Title lines
.TH
data
.TE
.TS H
global options;
column descriptors.
Title lines
.TH N
data
.TE

will cause the table heading to appear at the top of the first table segment, and no heading to appear at the top of the second segment when both appear on the same page. However, the heading will still appear at the top of each page that the table continues onto. This feature is used when a single table must be broken into segments because of table complexity (for example, too many blocks of filled text). If each segment had its own .TS H/.TH sequence, each segment would have its own header. However, if each table segment after the first uses .TS H/.TH N then the table header will only appear at the beginning of the table and the top of each new page or column that the table continues onto.

For nroff, the -e option (-E for mm(1) {2.1}) may be used for terminals, such as the 450, that are capable of finer printing resolution. This will cause better alignment of features such as the lines forming the corner of a box. Note that -e is not effective with col(1).

# 7.4 Equations

.DS

.EQ [label]

equation(s)

.EN

.DE

The equation setters eqn(1) and  $neqn^{[6]}$  expect to use the .EQ (equation start) and .EN (equation end) macros as delimiters in the same way that tbl(1) uses .TS and .TE; however, .EQ and .EN must occur inside a .DS/.DE pair.

There is an exception to this rule: if .EQ and .EN are used only to specify the delimiters for in-line equations or to specify eqn/neqn "defines," .DS and .DE must not be used; otherwise extra blank lines will appear in the output.

The .EQ macro takes an argument that will be used as a label for the equation. By default, the label will appear at the right margin in the "vertical center" of the general equation. The Eq register may be set to 1 to change the labeling to the left margin.

The equation will be centered for centered displays; otherwise the equation will be adjusted to the opposite margin from the label.

## 7.5 Figure, Table, Equation, and Exhibit Captions

.FG [title] [override] [flag]

.TB [title] [override] [flag]

.EC [title] [override] [flag]

.EX [title] [override] [flag]

The .FG (Figure Title), .TB (Table Title), .EC (Equation Caption) and .EX (Exhibit Caption) macros are normally used inside .DS/.DE pairs to automatically number and title figures, tables, and equations. They use registers Fg, Tb, Ec, and Ex, respectively (see  $\{2.4\}$  on -rN5 to reset counters in sections). As an example, the call:

.FG "This is an illustration"

yields:

#### Figure 1. This is an illustration

.TB replaces "Figure" by "TABLE"; .EC replaces "Figure" by "Equation", and .EX replaces "Figure" by "Exhibit". Output is centered if it can fit on a single line; otherwise, all lines but the first are indented to line up with the first character of the title. The format of the numbers may be changed using the .af request of the formatter. The format of the caption may be changed from "Figure 1. Title" to "Figure 1 - Title" by setting the Of register to 1.

The override string k used to modify the normal numbering. If flag is omitted or 0, override is used as a prefix to the number; if flag is 1, override is used as a suffix; and if flag is 2, override replaces the number. If -rN5 {2.4} is given, "section-figure" numbering is set automatically and user-specified override string is ignored.

As a matter of style, table headings are usually placed ahead of the text of the tables, while figure, equation, and exhibit captions usually occur after the corresponding figures and equations.

# 7.6 List of Figures, Tables, Equations, and Exhibits

A List of Figures, List of Tables, List of Exhibits, and List of Equations may be obtained. They will be printed after the Table of Contents is printed if the number registers Lf, Lt, and Le (respectively) are set to 1. Lf, Lt, and Lx are 1 by default; Le is 0 by default.

The titles of these Lists may be changed by redefining the following strings which are shown here with their default values:

.ds Lf LIST OF FIGURES
.ds Lt LIST OF TABLES
.ds Lx LIST OF EXHIBITS

#### 8. FOOTNOTES

There are two macros that delimit the text of footnotes, <sup>17</sup> a string used to automatically number the footnotes, and a macro that specifies the style of the footnote text.

# 8.1 Automatic Numbering of Footnotes

Footnotes may be automatically numbered by typing the three characters "\*F" (i.e., invoking the string F) immediately after the text to be footnoted, without any intervening spaces. This will place the next sequential footnote number (in a smaller point size) a half-line above the text to be footnoted.

## 8.2 Delimiting Footnote Text

There are two macros that delimit the text of each footnote:

.FS [label]
one or more lines of footnote text

The .FS (footnote start) marks the beginning of the text of the footnote, and the .FE marks its end. The label on the .FS, if present, will be used to mark the footnote text. Otherwise, the number retrieved from the string F will be used. Note that automatically-numbered and user-labeled footnotes may be intermixed. If a footnote is labeled (.FS label), the text to be footnoted must be followed by label, rather than by "\\*F". The text between .FS and .FE is processed in fill mode. Another .FS, a .DS, or a .DF are not permitted between the .FS and .FE macros. Automatically numbered footnotes may not be used for information, such as the title and abstract, to be placed on the cover sheet, but labeled footnotes are allowed. Similarly, only labeled footnotes may be used with tables \{7.3\}. Examples:

1. Automatically-numbered footnote:

This is the line containing the word\\*F.FS
This is the text of the footnote.
.FE
to be footnoted.

## 2. Labelled footnote:

This is a labeled\*
.FS \*
The footnote is labeled with an asterisk.
.FE
footnote.

The text of the footnote (enclosed within the .FS/.FE pair) should immediately follow the word to be footnoted in the input text, so that "\\*F" or label occurs at the end of a line of input and the next line

<sup>17.</sup> Footnotes are processed in an environment that is different from that of the body of the text (see the .ev request[2]).

Memorandum Macros 35

is the .FS macro call. It is also good practice to append a unpaddable space {3.3} to "\\*F" or label when they follow an end-of-sentence punctuation mark (i.e., period, question mark, exclamation point).

Appendix B illustrates the various available footnote styles as well as numbered and labeled footnotes.

#### 8.3 Format of Footnote Text •

# .FD [arg] [1]

Within the footnote text, the user can control the formatting style by specifying text hyphenation, right margin justification, and text indentation, as well as left- or right-justification of the label when text indenting is used. The .FD macro is invoked to select the appropriate style. The first argument is a number from the left column of the following table. The formatting style for each number is given by the remaining four columns. For further explanation of the first two of these columns, see the definitions of the .ad, .hy, .na, and .nh requests<sup>[2]</sup>.

arg	Hyphenation	Adjust	Text Indent	Label Justification
0	.nh	.ad	text indent	label left justified
1	.hy	.ad	π	п
2	.nh	.na		"
3	.hy	.na	π	n
4	.nh	.ad	no text indent	"
5	.hy	.ad	"	"
6	.nh	.na	n .	"
7	.hy	.na	п	п
8	.nh	.ad	text indent	label right justified
9	.hy	.ad	"	"
10	.nh	.na	п	П
11	.hy	.na	<b>"</b>	n

If the first argument to .FD is out of range, the effect is as if .FD 0 were specified. If the first argument is omitted or null, the effect is equivalent to .FD 10 in *nroff* and to .FD 0 in *troff*; these are also the respective initial defaults.

If a second argument is specified, then whenever a first-level heading is encountered, automaticallynumbered footnotes begin again with 1. This is most useful with the "section-page" page numbering scheme. As an example, the input line:

maintains the default formatting style and causes footnotes to be numbered afresh after each first-level heading.

For long footnotes that continue onto the following page, it is possible that, if hyphenation is permitted, the last line of the footnote on the current page will be hyphenated. Except for this case (over which the user has control by specifying an even argument to .FD), hyphenation across pages is inhibited by MM.

Footnotes are separated from the body of the text by a short rule. Footnotes that continue to the next page are separated from the body of the text by a full-width rule. In troff, footnotes are set in type that is two points smaller than the point size used in the body of the text.

# 8.4 Spacing between Footnote Entries

Normally, one blank line (a three-point vertical space) separates the footnotes when more than one occurs on a page. To change this spacing, set the register Fs to the desired value. For example:

will cause two blank lines (a six-point vertical space) to occur between footnotes.

#### 9. PAGE HEADERS AND FOOTERS

Text that occurs at the top of each page is known as the page header. Text printed at the bottom of each page is called the page footer. There can be up to three lines of text associated with the header: every page, even page only, and odd page only. Thus the page header may have up to two lines of text: the line that occurs at the top of every page and the line for the even- or odd-numbered page. The same is true for the page footer.

This section first describes the default appearance of page headers and page footers, and then the ways of changing them. We use the term *header* (not qualified by even or odd) to mean the line of the page header that occurs on every page, and similarly for the term footer.

#### 9.1 Default Headers and Footers

By default, each page has a centered page number as the header {9.2}. There is no default footer and no even/odd default headers or footers, except as specified in {9.9}.

In a memorandum or a released paper, the page header on the first page is automatically suppressed provided a break does not occur before .MT is called. The macros and text of  $\{6.9\}$  and of  $\{9\}$  as well as .nr and .ds requests do not cause a break and are permitted before the .MT macro call.

## 9.2 Page Header

.PH [arg]

For this and for the .EH, .OH, .PF, .EF, .OF macros, the argument is of the form:

" left-part center-part right-part "

If it is inconvenient to use the apostrophe (\*) as the delimiter (i.e., because it occurs within one of the parts), it may be replaced *uniformly* by *any* other character. On output, the parts are left-justified, centered, and right-justified, respectively. See {9.11} for examples.

The .PH macro specifies the header that is to appear at the top of every page. The initial value (as stated in  $\{9.1\}$ ) is the default centered page number enclosed by hyphens. The page number contained in the P register is an Arabic number. The format of the number may be changed by the .af request.

If debug mode is set using the flag -rD1 on the command line {2.4}, additional information, printed at the top left of each page, is included in the default header. This consists of the SCCS<sup>[10]</sup> Release and Level of MM (thus identifying the current version {12.3}), followed by the current line number within the current input file.

#### 9.3 Even-Page Header

.EH [arg]

The .EH macro supplies a line to be printed at the top of each even-numbered page, immediately following the header. The initial value is a blank line.

## 9.4 Odd-Page Header

.OH [arg]

This macro is the same as .EH, except that it applies to odd-numbered pages.

# 9.5 Page Footer

.PF [arg]

The .PF macro specifies the line that is to appear at the bottom of each page. Its initial value is a blank line. If the -rCn flag is specified on the command line  $\{2.4\}$ , the type of copy follows the footer on a separate line. In particular, if -rC3 or -rC4 (DRAFT) is specified, then, in addition, the footer is initialized to contain the date  $\{6.7.1\}$ , instead of being a blank line.

Memorandum Macros 37

### 9.6 Even-Page Footer

.EF [arg]

The .EF macro supplies a line to be printed at the bottom of each even-numbered page, immediately preceding the footer. The initial value is a blank line.

#### 9.7 Odd-Page Footer

.OF [arg]

This macro is the same as .EF, except that it applies to odd-numbered pages.

# 9.8 Footer on the First Page

By default, the footer is a blank line. If, in the input text, one specifies .PF and/or .OF before the end of the first page of the document, then these lines will appear at the bottom of the first page.

The header (whatever its contents) replaces the footer on the first page only if the -rN1 flag is specified on the command line  $\{2.4\}$ .

### 9.9 Default Header and Footer with "Section-Page" Numbering

Pages can be numbered sequentially within sections {4.5}. To obtain this numbering style, specify -rN3 or -rN5 on the command line. In this case, the default *footer* is a centered "section-page" number, e.g. 7-2, and the default page header is blank.

## 9.10 Use of Strings and Registers in Header and Footer Macros •

String and register names may be placed in the arguments to the header and footer macros. If the value of the string or register is to be computed when the respective header or footer is printed, the invocation must be escaped by four (4) backslashes. This is because the string or register invocation will be processed three times:

- as the argument to the header or footer macro;
- in a formatting request within the header or footer macro;
- in a .tl request during header or footer processing.

For example, the page number register P must be escaped with four backslashes in order to specify a header in which the page number is to be printed at the right margin, e.g.:

creates a right-justified header containing the word "Page" followed by the page number. Similarly, to specify a footer with the "section-page" style, one specifies (see {4.2.2.5} for meaning of H1):

As another example, suppose that the user arranges for the string a to contain the current section heading which is to be printed at the bottom of each page. The .PF macro call would then be:

If only one or two backslashes were used, the footer would print a constant value for a, namely, its value when the .PF appeared in the input text.

#### 9.11 Header and Footer Example •

The following sequence specifies blank lines for the header and footer lines, page numbers on the outside edge of each page (i.e., top left margin of even pages and top right margin of odd pages), and "Revision 3" on the top inside margin of each page:

```
.PH ""
.PF ""
.EH "^\\\nP^ Revision 3^"
.OH " Revision 3^ \\\\nP^ "
```

### 9.12 Generalized Top-of-Page Processing •

This section is intended only for users accustomed to writing formatter macros.

During header processing, MM invokes two user-definable macros. One, the .TP macro, is invoked in the environment (see .ev request<sup>[2]</sup>) of the header; the other, .PX, is a user-exit macro that is invoked (without arguments) when the normal environment has been restored, and with "no-space" mode already in effect.

The effective initial definition of .TP (after the first page of a document) is:

```
.de TP

sp 3
.tl \\*(}t
.if e 'tl \\*(}e
.if o 'tl \\*(}o

sp 2
```

The string \( \)t contains the header, the string \( \)e contains the even-page header, and the string \( \)e contains the odd-page header, as defined by the .PH, .EH, and .OH macros, respectively. To obtain more specialized page titles, the user may redefine the .TP macro to cause any desired header processing \( \)e 12.5\cdot\. Note that formatting done within the .TP macro is processed in an environment different from that of the body.

For example, to obtain a page header that includes three centered lines of data, say, a document's number, issue date, and revision date, one could define .TP as follows:

```
.de TP
.sp
.ce 3
777-888-999
Iss. 2, AUG 1977
Rev. 7, SEP 1977
.sp
```

The .PX macro may be used to provide text that is to appear at the top of each page after the normal header and that may have tab stops to align it with columns of text in the body of the document.

# 9.13 Generalized Bottom-of-Page Processing

```
.BS
zero or more lines of text
.BE
```

Lines of text that are specified between the .BS (bottom-block start) and .BE (bottom-block end) macros will be printed at the bottom of each page, <sup>18</sup> after the footnotes (if any), but before the page footer. This block of text is removed by specifying an empty block, i.e.:

<sup>18.</sup> The bottom block will appear on the table of contents pages and the cover sheet for Memorandum for File, but not on the Technical Memorandum or released-paper cover sheets.

.BS

.BE

## 9.14 Top and Bottom Margins

.VM [top] [bottom]

.VM (Vertical Margin) allows the user to specify extra space at the top and bottom of the page. This space precedes the page header and follows the page footer. .VM takes two unscaled arguments that are treated as v's. For example:

.VM 10 15

adds 10 blank lines to the default top of page margin, and 15 blank lines to the default bottom of page margin. Both arguments must be positive (default spacing at the top of the page may be decreased by redefining .TP).

# 9.15 Proprietary Markings

.PM [code]

.PM, for Proprietary Marking, appends to the page footer a PRIVATE, NOTICE, BELL LABORATORIES PROPRIETARY, or BELL LABORATORIES RESTRICTED disclaimer. The code may be:

Code	Meaning
none	turn off previous disclaimer, if any
P	PRIVATE
N	NOTICE
BP	BELL LABORATORIES PROPRIETARY
BR	BELL LABORATORIES RESTRICTED

The disclaimers are in a form approved for use by the Bell System.

## 9.16 Private Documents

.nr Pv value

The word "PRIVATE" may be printed centered and underlined on the second line of a document (preceding the page header). This is done by setting the Pv register:

Value	Meaning
0	do not print PRIVATE (default)
1	PRIVATE on first page only
2	PRIVATE on all pages

If Pv is 2, the user definable .TP may not be used because .TP is used by MM to print PRIVATE on all pages except the first page of a memorandum on which .TP is not invoked.

#### 10. TABLE OF CONTENTS AND COVER SHEET

The table of contents and the cover sheet for a document are produced by invoking the .TC and .CS macros, respectively.

This section will refer to cover sheets for Technical Memoranda and released papers only. The mechanism for producing a Memorandum for File cover sheet was discussed earlier {6.4}.

These macros should normally appear only once at the end of the document, after the Signature Block {6.11.1} and Notations {6.11.2} macros. They may occur in either order.

The table of contents is produced at the end of the document because the entire document must be processed before the table of contents can be generated. Similarly, the cover sheet is often not needed, and is therefore produced at the end.

#### 10.1 Table of Contents

.TC [slevel] [spacing] [tlevel] [tab] [head1] [head2] [head3] [head4] [head5]

The .TC macro generates a table of contents containing the headings that were saved for the table of contents as determined by the value of the *Cl* register {4.4}. The arguments to .TC control the spacing before each entry, the placement of the associated page number, and additional text on the first page of the table of contents before the word "CONTENTS."

Spacing before each entry is controlled by the first two arguments; headings whose level is less than or equal to slevel will have spacing blank lines (halves of a vertical space) before them. Both slevel and spacing default to 1. This means that first-level headings are preceded by one blank line (½ a vertical space). Note that slevel does not control what levels of heading have been saved; the saving of headings is the function of the Cl register {4.4}.

The third and fourth arguments control the placement of the page number for each heading. The page numbers can be justified at the right margin with either blanks or dots ("leaders") separating the heading text from the page number, or the page numbers can follow the heading text. For headings whose level is less than or equal to tlevel (default 2), the page numbers are justified at the right margin. In this case, the value of tab determines the character used to separate the heading text from the page number. If tab is 0 (the default value), dots (i.e., leaders) are used; if tab is greater than 0, spaces are used. For headings whose level is greater than tlevel, the page numbers are separated from the heading text by two spaces (i.e., they are "ragged right").

All additional arguments (e.g., head1, head2, etc.), if any, are horizontally centered on the page, and precede the actual table of contents itself.

If the .TC macro is invoked with at most four arguments, then the user-exit macro .TX is invoked (without arguments) before the word "CONTENTS" is printed; or the user-exit macro .TY is invoked and the word "CONTENTS" is not printed. By defining .TX or .TY and invoking .TC with at most four arguments, the user can specify what needs to be done at the top of the (first) page of the table of contents. For example, the following input:

.de TX
.ce 2
Special Application
Message Transmission
.sp 2
.in +10n
Approved: \1^3i^.in
.sp
..
.TC
yields:

Special Application Message Transmission

Approved:

CONTENTS

If this macro were defined as .TY rather than .TX, the word "CONTENTS" would not appear. Defining .TY as an empty macro will suppress "CONTENTS" with no replacement:

.de TY

By default, the first level headings will appear in the table of contents at the left margin. Subsequent levels will be aligned with the text of headings at the preceding level. These indentations may be changed by defining the Ci string which takes a maximum of seven arguments corresponding to the heading levels. It must be given at least as many arguments as are set by the Cl register  $\{4.4\}$ . The arguments must be scaled. For example, with Cl=5,

.ds Ci .25i .5i .75i 1i 1i

or

.ds Ci 0 2n 4n 6n 8n

Two other registers are available to modify the format of the table of contents, Oc and Cp. By default, table of contents pages will have lower-case Roman numeral page numbering. If the Oc register is set to 1, the .TC macro will not print any page number but will instead reset the P register to 1. It is the user's responsibility to give an appropriate page footer to place the page number. Ordinarily the same .PF used in the body of the document will be adequate.

The List of Figures, Tables, etc. pages will be produced separately unless Cp is set to 1 which causes these lists to appear on the same page as the table of contents.

#### 10.2 Cover Sheet

.CS [pages] [other] [total] [figs] [tbls] [refs]

The .CS macro generates a cover sheet in either the released paper or Technical Memorandum style (see {6.4} for details of the Memorandum for File cover sheet). All the other information for the cover sheet is obtained from the data given before the .MT macro call {6.9}. If the Technical Memorandum style is used, the .CS macro generates the "Cover Sheet for Technical Memorandum." The data that appear in the lower left corner of the Technical Memorandum cover sheet [9] (the counts of: pages of text, other pages, total pages, figures, tables, and references) are generated automatically (0 is used for the count of "other pages"). These values may be changed by supplying the corresponding arguments to the .CS macro. If the released-paper style is used, all arguments to .CS are ignored.

#### 11. REFERENCES

There are two macros that delimit the text of references, a string used to automatically number the references, and an optional macro to produce reference pages within the document.

#### 11.1 Automatic Numbering of References

Automatically numbered references may be obtained by typing  $\ensuremath{\mbox{\mbox{$\setminus$}}} (Rf (i.e., invoking the string <math>Rf)$  immediately after the text to be referenced. This places the next sequential reference number (in a smaller point size) enclosed in brackets a half-line above the text to be referenced, as illustrated throughout this document. The reference count is kept in the number register Rf.

#### 11.2 Delimiting Reference Text

The .RS and .RF macros are used to delimit the text of each reference.

A line of text to be referenced\\*(Rf. .RS [string-name] reference text .RF

#### 11.3 Subsequent References

.RS takes one argument, a string-name. For example:

.RS aA reference text .RF

The string aA is assigned the current reference number. It may be used later in the document, as the string call,  $\*(aA)$ , to reference text which must be labeled with a prior reference number. The reference is output enclosed in brackets a half-line above the text to be referenced. No .RS/.RF pair is needed for subsequent references.

#### 11.4 Reference Page

A reference page, entitled by default "References", will be generated automatically at the end of the document (before the Table of Contents and the Cover Sheet) and will be listed in the Table of Contents. This page contains the reference items (i.e., text enclosed within .RS/.RF pairs). Reference items will be separated by a space (1/2 space) unless the Ls register is set to 0 to suppress this spacing. The user may change the reference page title by defining the Rp string:

.ds Rp "New Title"

The .RP (Reference Page) macro may be used to produce reference pages anywhere else within a document (i.e., after each major section); .RP is not needed to produce a separate reference page with default spacings at the end of the document.

.RP [arg1] [arg2]

The two arguments allow the user to control resetting of reference numbering and page skipping.

argl	Meaning
0	reset reference counter (default)
1	do not reset reference counter

arg2	Meaning
0	put on separate page (default)
1	do not cause a following .SK
2	do not cause a preceding .SK
3	no .SK before or after

If no .SK is issued by .RP, then a single blank line will separate the References from the following (preceding) text. The user may wish to adjust the spacing. For example, to produce references at the end of each major section:

.sp 3 .RP 1 2 .H 1 "Next Section"

#### 12. MISCELLANEOUS FEATURES

## 12.1 Bold, Italic, and Roman Fonts

.B [bold-arg] [previous-font-arg] ...
.I [italic-arg] [previous-font-arg] ...
.R

When called without arguments, .B changes the font to bold and .I changes to underlining (italic). This condition continues until the occurrence of a .R, when the (regular) roman font is restored. Thus:

.I here is some text. .R

yields:

here is some text.

If .B or .I is called with one argument, that argument is printed in the appropriate font (underlined in nroff for .I). Then the previous font is restored (underlining is turned off in nroff). If two or more arguments (maximum 6) are given to a .B or .I, the second argument is then concatenated to the first with no intervening space (1/12 space if the first font is italic), but is printed in the previous font; and the remaining pairs of arguments are similarly alternated. For example:

.I italic " text " right -justified

produces:

italic text right-justified

These macros alternate with the prevailing font at the time they are invoked. To alternate specific pairs of fonts, the following macros are available:

.IB .BI .IR .RI .RB .BR

Each takes a maximum of 6 arguments and alternates the arguments between the specified fonts.

Note that font changes in headings are handled separately {4.2.2.4.1}.

Anyone using a terminal that cannot underline might wish to insert:

.rm ul

at the beginning of the document to eliminate all underlining.

### 12.2 Justification of Right Margin

.SA [arg]

The .SA macro is used to set right-margin justification for the main body of text. Two justification flags are used: current and default. .SA 0 sets both flags to no justification, i.e., it acts like the .na request. .SA 1 is the inverse: it sets both flags to cause justification, just like the .ad request. However, calling .SA without an argument causes the current flag to be copied from the default flag, thus performing either a .na or .ad, depending on what the default is. Initially, both flags are set for no justification in nroff and for justification in troff.

In general, the request .na can be used to ensure that justification is turned off, but .SA should be used to restore justification, rather than the .ad request. In this way, justification or lack thereof for the remainder of the text is specified by inserting .SA 0 or .SA 1 once at the beginning of the document.

#### 12.3 SCCS Release Identification

The string RE contains the SCCS<sup>[10]</sup> Release and Level of the current version of MM. For example, typing:

This is version \\*(RE of the macros.

produces:

This is version 15.128 of the macros.

This information is useful in analyzing suspected bugs in MM. The easiest way to have this number appear in your output is to specify -rD1 {2.4} on the command line, which causes the string RE to be output as part of the page header {9.2}.

# 12.4 Two-Column Output

MM can print two columns on a page:

.2C text and formatting requests (except another .2C) .1C

The .2C macro begins two-column processing which continues until a .1C macro is encountered. In two-column processing, each physical page is thought of as containing two columnar "pages" of equal (but smaller) "page" width. Page headers and footers are not affected by two-column processing. The .2C macro does not "balance" two-column output.

It is possible to have full-page width footnotes and displays when in two column mode, although the default action is for footnotes and displays to be narrow in two column mode and wide in one column mode. Footnote and display width is controlled by a macro, .WC (Width Control), which takes the following arguments:

arg	Meaning
N	Normal default mode (-WF, -FF, -WD, FB)
WF	Wide Footnotes always (even in two column mode)
-WF	DEFAULT: turn off WF (footnotes follow column mode, wide in 1C mode, narrow in 2C mode, unless FF is set)
FF	First Footnote; all footnotes have the same width as the first footnote encountered for that page
-FF	DEFAULT: turn off FF (footnote style follows the settings of WF or -WF)
WD	Wide Displays always (even in two column mode)
-WD	DEFAULT: Displays follow whichever column mode is in effect when the display is encountered
FB	DEFAULT: Floating displays cause a break when output on the current page
-FB	Floating displays on current page do not cause a break

For example: ".WC WD FF" will cause all displays to be wide, and all footnotes on a page to be the same width, while ".WC N" will reinstate the default actions. If conflicting settings are given to .WC the last one is used. That is, ".WC WF -WF" has the effect of ".WC -WF".

# 12.5 Column Headings for Two-Column Output •

This section is intended only for users accustomed to writing formatter macros.

In two-column output, it is sometimes necessary to have headers over each column, as well as headers over the entire page {9}. This is accomplished by redefining the .TP macro {9.12} to provide header lines both for the entire page and for each of the columns. For example:

```
.de TP
.sp 2
.tl 'Page \\nP'OVERALL'
.tl 'TITLE'
.sp
.nf
.ta 16C 31R 34 50C 65R
left→center→right→left→center→right
→first column→→⇒second column
.fi
.sp 2
...
```

The above example will produce two lines of page header text plus two lines of headers over each column. The tab stops are for a 65-en overall line length.

# 12.6 Vertical Spacing

.SP [lines]

There exist several ways of obtaining vertical spacing, all with different effects: the .sp request spaces the number of lines specified, unless "no space" (.ns) mode is on, in which case the request is ignored. This mode is set at the end of a page header to eliminate spacing by a .sp or .bp request that happens to occur at the top of a page. This mode can be turned off by the .rs ("restore spacing") request.

The .SP macro is used to avoid the accumulation of vertical space by successive macro calls. Several .SP calls in a row produce not the sum of their arguments, but their maximum; i.e., the following produces only 3 blank lines:

.SP 2 .SP 3

Many MM macros utilize .SP for spacing. For example, ".LE 1" {5.3.2} immediately followed by ".P" {4.1} produces only a single blank line (½ a vertical space) between the end of the list and the following paragraph. An omitted argument defaults to one blank line (one vertical space). Negative arguments are not permitted. The argument must be unscaled but fractional amounts are permitted. Like .sp, .SP is also inhibited by the .ns request.

# 12.7 Skipping Pages

.SK [pages]

The .SK macro skips pages, but retains the usual header and footer processing. If pages is omitted, null, or 0, .SK skips to the top of the next page unless it is currently at the top of a page, in which case it does nothing. .SK n skips n pages. That is, .SK always positions the text that follows it at the top of a page, while .SK 1 always leaves one page that is blank except for the header and footer.

## 12.8 Forcing an Odd Page

.OP

This macro is used to ensure that the text following it begins at the top of an odd-numbered page. If currently at the top of an odd page, no motion takes place. If currently on an even page, text resumes printing at the top of the next page. If currently on an odd page (but not at the top of the page) one blank page is produced, and printing resumes on the page after that.

46

## 12.9 Setting the Point Size and Vertical Spacing

In troff, the default point size (obtained from the MM register S {2.4}) is 10 points, and the vertical spacing is 12 points (i.e., 6 lines per inch). The prevailing point size and vertical spacing may be changed by invoking the S macro:

# .S [point size] [vertical spacing]

The mnemonics D (default value), C (current value), and P (previous value) may be used for both arguments. If an argument is negative, the current value is decremented by the specified amount; if an argument is positive, the current value is incremented by the specified amount; if an argument is unsigned, it is used as the new value; S without arguments defaults to P. If the first argument is specified but the second is not, then D is used for the vertical spacing; the default value for vertical spacing is always 2 points greater than the *current* point size. A null ("") value for either argument defaults to C. Thus, if n is a numeric value:

```
.S = .S P P

.S "" n = .S C n

.S n "" = .S n C

.S n = .S n D

.S "" = .S C D

.S "" "" = .S C C

.S n n = .S n n
```

If the first argument is greater than 99, the default point size (10 points) is restored. If the second argument is greater than 99, the default vertical spacing (current point size plus 2 points) is used. For example:

```
.S 100 = .S 10 12
.S 14 111 = .S 14 16
```

The .SM macro allows one to reduce by 1 point the size of a string:

# .SM string1 [string2] [string3]

If the third argument is omitted, the *first* argument is made smaller and is concatenated with the second argument, if the latter is specified. If all three arguments are present (even if any are null), the *second* argument is made smaller and all three arguments are concatenated. For example:

left than make. Resemble default value are not alod, where it all one libbs.

.SM X	gives	X
.SM X Y	gives	XY
.SM Y X Y	gives	YXY
.SM UNIX	gives	UNIX
.SM UNIX )	gives	UNIX)
.SM (UNIX)	gives	(UNIX)
.SM U NIX ""	gives	UNIX

<sup>19.</sup> Footnotes {8} are two points smaller than the body, with an additional three-point space between footnotes.

## 12.10 Producing Accents

The following strings may be used to produce accents for letters:

	Input	Outpu
Grave accent	e\*	è
Acute accent	e\*	é
Circumflex	0/*	ô
Tilde	n\*~	ñ
Cedilla	c\*,	ç
Lower-case umlaut	u\*:	ü
Upper-case umlaut	U\*;	Ü

# 12.11 Inserting Text Interactively •

.RD [prompt] [diversion] [string]

.RD (ReaD insertion) allows a user to stop the standard output of a document and to read text from the standard input until two consecutive new-lines are found. When the new-lines are encountered, normal output is resumed.

.RD follows the formatting conventions in effect. Thus, the examples below assume that the .RD is invoked in no fill mode (.nf).

The first argument is a prompt which will be printed at the terminal. If no prompt is given, .RD signals the user with a BEL on terminal output.

The second argument, the name of a diversion, allows the user to save all the text typed in after the prompt in a macro whose name is that of the diversion. The third argument, the name of a string, allows the user to save for later reference the first line following the prompt in the named string. For example:

.RD Name aA bB

produces:

Name: (user types) J. Jones 16 Elm Rd., Piscataway

The diverted macro .aA will contain:

J. Jones 16 Elm Rd., Piscataway

The string bB (\\*(bB) contains "J. Jones".

A new-line followed by a control-d (EOF) also allows the user to resume normal output.

#### 13. ERRORS AND DEBUGGING

#### 13.1 Error Terminations

When a macro discovers an error, the following actions occur:

- · A break occurs.
- To avoid confusion regarding the location of the error, the formatter output buffer (which may contain some text) is printed.

- A short message is printed giving the name of the macro that found the error, the type of error, and the approximate line number (in the current input file) of the last processed input line. (All the error messages are explained in Appendix D.)
- Processing terminates, unless the register D {2.4} has a positive value. In the latter case, processing continues even though the output is guaranteed to be deranged from that point on.
- The error message is printed by writing it directly to the user's terminal. If an output filter, such as 300(1), 450(1), or hp(1) is being used to post-process nroff output, the message may be garbled by being intermixed with text held in that filter's output buffer.
- If any of cw(1), eqn(1)/neqn, and tbl(1) are being used, and if the -olist option of the formatter causes the last page of the document not to be printed, a harmless "broken pipe" message may result.

# 13.2 Disappearance of Output

This usually occurs because of an unclosed diversion (e.g., missing .DE or .FE). Fortunately, the macros that use diversions are careful about it, and they check to make sure that illegal nestings do not occur. If any message is issued about a missing .DE or .FE, the appropriate action is to search backwards from the termination point looking for the corresponding .DF, .DS, or .FS.

The following command:

```
grep -n "^\.[EDFRT][EFNQS]" files ...
```

prints all the .DF, .DS, .DE, .EQ, .EN, .FS, .FE, .RS, .RF, .TS, and .TE macros found in files ..., each preceded by its file name and the line number in that file. This listing can be used to check for illegal nesting and/or omission of these macros.

## 14. EXTENDING AND MODIFYING THE MACROS •

#### 14.1 Naming Conventions

In this section, the following conventions are used to describe names:

- n: digit
- a: lower-case letter
- A: upper-case letter
- x: n, a, or A: i.e., any letter or digit (any alphanumeric character)
- s: special character (any non-alphanumeric character)

All other characters are literals (i.e., stand for themselves).

Note that request, macro, and string names are kept by the formatters in a single internal table, so that there must be no duplication among such names. Number register names are kept in a separate table.

#### 14.1.1 Names Used by Formatters

requests:

aa (most common)

an (only one, currently: c2)

registers:

aa (normal)

.x (normal)

.s (only one, currently: .\$)

a. (only one, currently: c.)

% (page number)

# 14.1.2 Names Used by MM

macros and strings: A, AA, Aa (accessible to users; e.g., macros P and HU, strings F, BU, and Lt)

nA (accessible to users; only two, currently: 1C and 2C)

aA (accessible to users; only one, currently: nP)

s (accessible to users; only the seven accents, currently {12.10})

x, x, x, x, x (internal)

registers:

An, Aa (accessible to users; e.g., H1, Fg)

A (accessible to users; meant to be set on the command line; e.g., C)

:x, ;x, #x, ?x, !x (internal)

14.1.3 Names Used by CW, EQN/NEQN, and TBL. Cw(1), the constant-width font preprocessor for troff, uses the following five macro names: .CD, .CN, .CP, .CW, and .PC; it also uses the number register names cE and cW. The equation preprocessors, eqn(1) and neqn use registers and string names of the form nn. The table preprocessor, tbl(1), uses T&, T#, and TW, and names of the form:

```
a- a+ a| nn na ^a #a #s
```

14.1.4 User-Definable Names. Given the above, what is left for user extensions? To avoid "collisions" with already used names, use names that consist either of a single lower-case letter, or of a lower-case letter followed by a character other than a lower-case letter (remembering, however, that the names .c2 and .nP are already used). The following is a possible user naming convention:

```
macros: aA (e.g., bG, kW)
strings: as (e.g., c), f], p})
registers: a (e.g., f, t)
```

#### 14.2 Sample Extensions

14.2.1 Appendix Headings. The following is a way of generating and numbering appendix headings:

```
.nr Hu 1
.nr a 0
.de aH
.nr a +1
.nr P 0
.PH "^^ Appendix \\na-\\\\\nP^"
.SK
.HU "\\$1"
```

After the above initialization and definition, each call of the form ".aH "title"" begins a new page (with the page header changed to "Appendix a-n") and generates an unnumbered heading of title, which, if desired, can be saved for the table of contents. Those who wish apppendix titles to be centered must, in addition, set the register Hc to 1 {4.2.2.3}.

14.2.2 Hanging Indent with Tabs. The following example illustrates the use of the hanging-indent feature of variable-item lists {5.3.3.6}. First, a user-defined macro is built to accept four arguments that make up the mark. In the output, each argument is to be separated from the previous one by a tab; tab settings are defined later. Since the first argument may begin with a period or apostrophe, the "\&" is used so that the formatter will not interpret such a line as a formatter request or macro call.<sup>20</sup> The "\t" is translated by the formatter into a tab. The "\c" is used to concatenate the input text that follows the macro call to the line built by the macro. The macro and an example of its use are:

<sup>20.</sup> The two-character sequence "\&" is understood by the formatters to be a "zero-width" space, i.e., it causes no output characters to appear, but it removes the special meaning of a leading period or apostrophe.

.de aX .LI \&\\\$1\t\\\$2\t\\\$3\t\\\$4\t\c .ta 9n 18n 27n 36n .VL 36 .aX .nh off \- no No hyphenation. Automatic hyphenation is turned off. Words containing hyphens (e.g., mother-in-law) may still be split across lines. .aX .hy on \- no Hyphenate. Automatic hyphenation is turned on. .aX .hc\Dc none none no Hyphenation indicator character is set to "c" or removed. During text processing the indicator is suppressed and will not appear in the output. Prepending the indicator to a word has the effect of preventing hyphenation of that word. .LE

(□ stands for a space)

# The resulting output is:

.nh	off	-	no	No hyphenation. Automatic hyphenation is turned off. Words containing hyphens (e.g., mother-in-law) may still be split across lines.
.hy	on	_	no	Hyphenate. Automatic hyphenation is turned on.
.hc c	none	none	no	Hyphenation indicator character is set to "c" or removed.  During text processing the indicator is suppressed and will not appear in the output. Prepending the indicator to a word has the effect of preventing hyphenation of that word.

## 15. CONCLUSION

The following are the qualities that we have tried to emphasize in MM, in approximate order of importance:

- Robustness in the face of error—A user need not be an nroff/troff expert to use these macros. When the input is incorrect, either the macros attempt to make a reasonable interpretation of the error, or a message describing the error is produced. We have tried to minimize the possibility that a user would get cryptic system messages or strange output as a result of simple errors.
- Ease of use for simple documents—It is not necessary to write complex sequences of commands to produce simple documents. Reasonable default values are provided, where at all possible.
- Parameterization— There are many different preferences in the area of document styling. Many
  parameters are provided so that users can adapt the output to their respective needs over a wide
  range of styles.
- Extension by moderately expert users—We have made a strong effort to use mnemonic naming conventions and consistent techniques in the construction of the macros. Naming conventions are given so that a user can add new macros or redefine existing ones, if necessary.

Memorandum Macros

- Device independence—The most common use of MM is to print documents on hard-copy typewriter terminals, using the nroff formatter. The macros can be used conveniently with both 10- and 12-pitch terminals. In addition, output can be scanned with an appropriate CRT terminal. The macros have been constructed to allow compatibility with troff, so that output can be produced both on typewriter-like terminals and on a phototypesetter.
- Minimization of input—The design of the macros attempts to minimize repetitive typing. For example, if a user wants to have a blank line after all first- or second-level headings, he or she need only set a specific parameter once at the beginning of a document, rather than add a blank line after each such heading.
- Decoupling of input format from output style—There is but one way to prepare the input text, although the user may obtain a number of output styles by setting a few global flags. For example, the .H macro is used for all numbered headings, yet the actual output style of these headings may be made to vary from document to document or, for that matter, within a single document.

Acknowledgements. We are indebted to T. A. Dolotta for his continuing guidance during the development of MM. We also thank our many users who have provided much valuable feedback, both about the macros and about this manual. Many of the features of MM are patterned after similar features in a number of earlier macro packages, and, in particular, after one implemented by M. E. Lesk. Finally, because MM often approaches the limits of what is possible with the text formatters, during the implementation of MM we have generated atypical requirements and encountered unusual problems; we thank the late J. F. Ossanna for his willingness to add new features to the formatters and to invent ways of having the formatters perform unusual but desired actions.

## Appendix A: USER-DEFINED LIST STRUCTURES •

This appendix is intended only for users accustomed to writing formatter macros.

If a large document requires complex list structures, it is useful to be able to define the appearance for each list level only once, instead of having to define it at the beginning of each list. This permits consistency of style in a large document. For example, a generalized list-initialization macro might be defined in such a way that what it does depends on the list-nesting level in effect at the time the macro is called. Suppose that levels 1 through 5 of lists are to have the following appearance:

```
A.
[1]

a)
```

The following code defines a macro (.aL) that always begins a new list and determines the type of list according to the current list level. To understand it, you should know that the number register :g is used by the MM list macros to determine the current list level; it is 0 if there is no currently active list. Each call to a list-initialization macro increments :g, and each .LE call decrements it.

```
.de aL

'\" register g is used as a local temporary to save :g before it is changed below
.nr g \\n(:g
.if \\ng=0 .AL A \" give me an A.
.if \\ng=1 .LB \\n(Li 0 1 4 \" give me a [1]
.if \\ng=2 .BL \" give me a bullet
.if \\ng=3 .LB \\n(Li 0 2 2 a \" give me an a)
.if \\ng=4 .ML + \" give me a +
```

This macro can be used (in conjunction with .LI and .LE) instead of .AL, .RL, .BL, .LB, and .ML. For example, the following input:

```
.aL
.LI
first line.
.aL
.LI
second line.
.LE
.LI
third line.
.LE
will yield:
A. first line.
```

[1] second line.

B. third line.

There is another approach to lists that is similar to the .H mechanism. The list-initialization, as well as the .LI and the .LE macros are all included in a single macro. That macro (called .bL below) requires

an argument to tell it what level of item is required; it adjusts the list level by either beginning a new list or setting the list level back to a previous value, and then issues a .LI macro call to produce the item:

```
.de bL
.ie \\n(.$ .nr g \\$1 \" if there is an argument, that is the level
.el .nr g \\n(:g \" if no argument, use current level
.if \\ng - \\n(:g > 1 .)D "**ILLEGAL SKIPPING OF LEVEL" \" increasing level by more than 1
.if \\ng - \\n(:g \ .aL \\ng - 1 \" if g > :g, begin new list
. nr g \\n(:g\) \" and reset g to current level (.aL changes g)
.if \\n(:g > \\ng .LC \\ng \" if :g > g, prune back to correct level
\" if :g = g, stay within current list
.LI \" in all cases, get out an item
```

For .bL to work, the previous definition of the .aL macro must be changed to obtain the value of g from its argument, rather than from :g. Invoking .bL without arguments causes it to stay at the current list level. The MM .LC macro (List Clear) removes list descriptions until the level is less than or equal to that of its argument. For example, the .H macro includes the call ".LC 0". If text is to be resumed at the end of a list, insert the call ".LC 0" to clear out the lists completely. The example below illustrates the relatively small amount of input needed by this approach. The input text:

to regard to define a later. The contains that argument may begin with a period analysis opine, the "Alert is and an east the first of more than the protection that he are a frequently engaged to be an east of the Anti-contained to the contained of the transfer of the "Agreement to be a contained to the protection of the Agreement to the contained of the contai

```
The quick brown fox jumped over the lazy dog's back.

.bL 1
first line.

.bL 2
second line.

.bL 1
third line.

.bL
fourth line.

.LC 0
fifth line.
```

#### yields:

The quick brown fox jumped over the lazy dog's back.

A. first line.

[1] second line.

B. third line.

C. fourth line.

fifth line.

#### Appendix B: SAMPLE FOOTNOTES

The following example illustrates several footnote styles and both labeled and automatically-numbered footnotes. The actual input for the immediately following text and for the footnotes at the bottom of this page is shown on the following page:

With the footnote style set to the *nroff* default, we process a footnote<sup>1</sup> followed by another one.\*\*\*\*\*
Using the .FD macro, we changed the footnote style to hyphenate, right margin justification, indent, and left justify the label. Here is a footnote,<sup>2</sup> and another.† The footnote style is now set, again via the .FD macro, to no hyphenation, no right margin justification, no indentation, and with the label left-justified. Here comes the final one.<sup>3</sup>

<sup>1.</sup> This is the first footnote text example (.FD 10). This is the default style for *nroff*. The right margin is *not* justified. Hyphenation is *not* permitted. The text is indented, and the automatically generated label is *right*-justified in the text-indent space.

<sup>\*\*\*\*\*</sup> This is the second footnote text example (.FD 10). This is also the default nroff style but with a long footnote label provided by the user.

<sup>2.</sup> This is the third footnote example (.FD 1). The right margin is justified, the footnote text is indented, the label is *left*-justified in the text-indent space. Although not necessarily illustrated by this example, hyphenation is permitted. The quick brown fox jumped over the lazy dog's back.

<sup>†</sup> This is the fourth footnote example (.FD 1). The style is the same as the third footnote.

<sup>3.</sup> This is the fifth footnote example (.FD 6). The right margin is not justified, hyphenation is not permitted, the footnote text is not indented, and the label is placed at the beginning of the first line. The quick brown fox jumped over the lazy dog's back. Now is the time for all good men to come to the aid of their country.

55

.FD 10 With the footnote style set to the .I nroff default, we process a footnote\\*F This is the first footnote text example (.FD 10). This is the default style for .I nroff. The right margin is .I not justified. Hyphenation is .I not permitted. The text is indented, and the automatically generated label is .I right -justified in the text-indent space. .FE (☐ stands for a space) followed by another one.\*\*\*\*\*\ .FS \*\*\*\*\* This is the second footnote text example (.FD 10). This is also the default style but with a long footnote label provided by the user. .FE .FD 1 Using the .FD macro, we changed the footnote style to hyphenate, right margin justification, indent, and left justify the label. Here is a footnote,\\*F This is the third footnote example (.FD 1). The right margin is justified, the footnote text is indented, the label is .I left -justified in the text-indent space. Although not necessarily illustrated by this example, hyphenation is permitted. The quick brown fox jumped over the lazy dog's back. .FE and another.\(dg\\ .FS \(dg This is the fourth footnote example (.FD 1). The style is the same as the third footnote. .FD 6 The footnote style is now set, again via the .FD macro, to no hyphenation, no right margin justification, no indentation, and with the label left-justified. Here comes the final one.\\*F\\ .FS This is the fifth footnote example (.FD 6). The right margin is .I not justified, hyphenation is .I not permitted, the footnote text is .I not indented, and the label is placed at the beginning of the first line. The quick brown fox jumped over the lazy dog's back. Now is the time for all good men to come to the aid of their country. .FE

#### Appendix D: ERROR MESSAGES

### I. MM Error Messages

An MM error message has a standard part followed by a variable part. The standard part has the form:

ERROR:(filename)input line n:

The variable part consists of a descriptive message, usually beginning with a macro name. The variable parts are listed below in alphabetical order by macro name, each with a more complete explanation:<sup>21</sup>

Check TL, AU, AS, AE, MT sequence The correct order of macros at the start of a memorandum is

shown in {6.9}. Something has disturbed this order. If .AS 2 was used, then the error message will be "Check TL, AU,

AS, AE, NS, NE, MT sequence".

CS:cover sheet too long The text of the cover sheet is too long to fit on one page. The

abstract should be reduced or the indent of the abstract should

be decreased {6.4}.

DE:no DS or DF active .DE has been encountered but there has not been a previous

.DS or .DF to match it.

DF:illegal inside TL or AS Displays are not allowed in the title or abstract.

DF:missing DE .DF occurs within a display, i.e., a .DE has been omitted or

mistyped.

DF:missing FE A display starts inside a footnote. The likely cause is the

omission (or misspelling) of a .FE to end a previous footnote.

DF:too many displays More than 26 floating displays are active at once, i.e., have

been accumulated but not yet output.

DS:illegal inside TL or AS Displays are not allowed in the title or abstract.

DS:missing DE .DS occurs within a display, i.e., a .DE has been omitted or

mistyped.

DS:missing FE A display starts inside a footnote. The likely cause is the

omission (or misspelling) of a .FE to end a previous footnote.

FE:no FS active .FE has been encountered with no previous .FS to match it.

FS:missing DE A footnote starts inside a display, i.e., a .DS or .DF occurs

without a matching .DE.

FS:missing FE A previous .FS was not matched by a closing .FE, i.e., an

attempt is being made to begin a footnote inside another one.

H:bad arg:value The first argument to .H must be a single digit from 1 to 7,

but value has been supplied instead.

H:missing arg .H needs at least 1 argument.

H:missing DE A heading macro (.H or .HU) occurs inside a display.

H:missing FE A heading macro (.H or .HU) occurs inside a footnote.

<sup>21.</sup> This list is set up by ".LB 37 0 2 0" {5.4}.

HU:missing arg .HU needs 1 argument.

LB:missing arg(s) .LB requires at least 4 arguments.

LB:too many nested lists Another list was started when there were already 6 active lists.

LE:mismatched .LE has occurred without a previous .LB or other list-initialization macro {5.3.3}. Although this is not a fatal error, the message is issued because there almost certainly exists

some problem in the preceding text.

LI:no lists active .LI occurs without a preceding list-initialization macro. The latter has probably been omitted, or has been separated from

the .LI by an intervening .H or .HU.

ML:missing arg .ML requires at least 1 argument.

ND:missing arg .ND requires 1 argument.

RF:no RS active .RF has been encountered with no previous .RS to match it.

RP:missing RF A previous .RS was not matched by a closing .RF.

RS:missing RF A previous .RS was not matched by a closing .RF.

S:bad arg:value The incorrect argument value has been given for .S, see

[12.9].

SA:bad arg:value The argument to .SA (if any) must be either 0 or 1. The

incorrect argument is shown as value.

SG:missing DE .SG occurs inside a display.

SG:missing FE .SG occurs inside a footnote.

SG:no authors .SG occurs without any previous .AU macro(s).

VL:missing arg .VL requires at least 1 argument.

WC:unknown option An incorrect argument has been given to .WC, see {12.4}.

## II. Formatter Error Messages

Most messages issued by the formatter are self-explanatory. Those error messages over which the user has (some) control are listed below. Any other error messages should be reported to the local system-support group.

- "Cannot do ev" is caused by (a) setting a page width that is negative or extremely short; (b) setting a page length that is negative or extremely short; (c) reprocessing a macro package (e.g., performing a .so formatter request on a macro package that was already requested on the command line); and (d) requesting the troff—s1 option on a document that is longer than ten pages.
- "Cannot execute filename" is given by the .! request if it cannot find the filename.
- "Cannot open filename" is issued if one of the files in the list of files to be processed cannot be opened.
- "Exception word list full" indicates that too many words have been specified in the hyphenation exception list (via .hw requests).
- "Line overflow" means that the output line being generated was too long for the formatter's line buffer. The excess was discarded. See the "Word overflow" message below.
- "Non-existent font type" means that a request has been made to mount an unknown font.
- "Non-existent macro file" means that the requested macro package does not exist.
- "Non-existent terminal type" means that the terminal options refers to an unknown terminal type.
- "Out of temp file space" means that additional temporary space for macro definitions, diversions, etc. cannot be allocated. This message often occurs because of unclosed diversions (missing .FE or .DE), unclosed macro definitions (e.g., missing ".."), or a huge table of contents.
- "Too many page numbers" is issued when the list of pages specified to the formatter -o option is too long.
- "Too many number registers" means that the pool of number register names is full. Unneeded registers can be deleted by using the .rr request.
- "Too many string/macro names" is issued when the pool of string and macro names is full. Unneeded strings and macros can be deleted using the .rm request.
- "Word overflow" means that a word being generated exceeded the formatter's word buffer. The excess characters were discarded. A likely cause for this and for the "Line overflow" message above are very long lines or words generated through the misuse of \c or of the .cu request, or very long equations produced by eqn(1)/neqn.

# Appendix E: SUMMARY OF MACROS, STRINGS, AND NUMBER REGISTERS

#### I. Macros

The following is an alphabetical list of macro names used by MM. The first line of each item gives the name of the macro, a brief description, and a reference to the section in which the macro is described. The second line gives a prototype call of the macro.

Macros marked with an asterisk are not, in general, invoked directly by the user. Rather, they are "user exits" defined by the user and called by the MM macros from inside header, footer, or other macros.

- 1C One-column processing {12.4}
  .1C
- 2C Two-column processing {12.4}
- AE Abstract end {6.4}
  .AE
- AF Alternate format of "Subject/Date/From" block {6.7.2}

Strings

The following is an alphabetical list of string names used by MM, giving for each a brief description, section reference, and initial (default) value(s). See {1.4} for notes on setting and referencing strings.

Bullet {3.7} BU nroff: ⊕ troff: • Table-of-contents indent list, up to seven args for heading levels (must be scaled) {10.1} Ci Date (current date, unless overridden) {6.7.1} DT Month day, year (e.g., March 27, 1981) Em dash string, produces an em dash in troff and a double hyphen in nroff {3.8}. EM F Footnote numberer {8.1}  $nroff: \u\n + (:p\d$ troff: v'-.4m'(s-3)(n+(:p)s0)v'.4m'Heading font list, up to seven codes for heading levels 1 through 7 {4.2.2.4.1} HF 3 3 2 2 2 2 2 (levels 1 and 2 bold, 3-7 underlined in nroff, and italic in troff) Heading point size list, up to seven codes for heading levels 1 through 7 {4.2.2.4.3} HP Title for LIST OF EQUATIONS {7.6} Le Title for LIST OF FIGURES {7.6} Lf

Title for LIST OF TABLES {7.6} Lt Title for LIST OF EXHIBITS {7.6} Lx SCCS Release and Level of MM {12.3} RE Release.Level (e.g., 15.128)

Reference numberer {11.1} Rf Title for References {11.4} Rp

Trademark string; places the letters "TM" one half-line above the text that it follows {3.9}.

Seven accent strings are also available {12.10}.

If the released-paper style is used, then, in addition to the above strings, certain BTL location codes are defined as strings; these location strings are needed only until the .MT macro is called {6.8}. Currently, the following are recognized: AK, AL, ALF, CB, CH, CP, DR, FJ, HL, HO, HOH, HP, IH, IN, INH, IW, MH, MV, PY, RD, RR, WB, WH, and WV.

#### III. Number Registers

This section provides an alphabetical list of register names, giving for each a brief description, section reference, initial (default) value, and the legal range of values (where [m:n] means values from m to n inclusive).

Any register having a single-character name can be set from the command line. An asterisk attached to a register name indicates that that register can be set *only* from the command line or *before* the MM macro definitions are read by the formatter {2.4, 2.5}. See {1.4} for notes on setting and referencing registers.

- A \* Handles preprinted forms and the Bell System logo {2.4} 0, [0:2]
- Au Inhibits printing of author's location, department, room, and extension in the "from" portion of a memorandum {6.2}
  1, [0:1]
- C\* Copy type (Original, DRAFT, etc.) {2.4} 0 (Original), [0:4]
- Cl Contents level (i.e., level of headings saved for table of contents) {4.4} 2, [0:7]
- Cp Placement of List of Figures, etc. {10.1} 1 (on separate pages), [0:1]
- D \* Debug flag {2.4} 0, [0:1]
- De Display eject register for floating dislays {7.2} 0, [0:1]
- Df Display format register for floating displays {7.2} 5, [0:5]
- Ds Static display pre- and post-space {7.1} 1, [0:1]
- E \* Controls font of the Subject/Date/From fields {2.4} 0 (nroff) 1 (troff), [0:1]
- Ec Equation counter, used by .EC macro {7.5} 0, [0:?], incremented by 1 for each .EC call.
- Ej Page-ejection flag for headings {4.2.2.1} 0 (no eject), [0:7]
- Eq Equation label placement {7.4} 0 (right-adjusted), [0:1]
- Ex Exhibit counter, used by .EX macro {7.5} 0, [0:?], incremented by 1 for each .EX call.
- Figure counter, used by .FG macro {7.5}
  0, [0:?], incremented by 1 for each .FG call.

- Fs Footnote space (i.e., spacing between footnotes) {8.4} 1, [0:?]
- H1-H7 Heading counters for levels 1-7 {4.2.2.5}
  0, [0:?], incremented by .H of corresponding level or .HU if at level given by register Hu.
  H2-H7 are reset to 0 by any heading at a lower-numbered level.
- Hb Heading break level (after .H and .HU) {4.2.2.2} 2, [0:7]
- Hc Heading centering level for .H and .HU {4.2.2.3} 0 (no centered headings), [0:7]
- Hi Heading temporary indent (after .H and .HU) {4.2.2.2} 1 (indent as paragraph), [0:2]
- Hs Heading space level (after .H and .HU) {4.2.2.2} 2 (space only after .H 1 and .H 2), [0:7]
- Ht Heading type (for .H: single or concatenated numbers) {4.2.2.5} 0 (concatenated numbers: 1.1.1, etc.), [0:1]
- Hu Heading level for unnumbered heading (.HU) {4.3} 2 (.HU at the same level as .H 2), [0:7]
- Hy Hyphenation control for body of document {3.4} 0 (automatic hyphenation off), [0:1]
- L\* Length of page {2.4} 66, [20:?] (11i, [2i:?] in troff)<sup>22</sup>
- Le List of Equations {7.6} 0 (list not produced) [0:1]
- Lf List of Figures {7.6} 1 (list produced) [0:1]
- Li List indent {5.3.3.1} 6 (nroff) 5 (troff), [0:?]
- Ls List spacing between items by level {5.3.3.1} 6 (spacing between all levels) [0:6]
- Lt List of Tables {7.6} 1 (list produced) [0:1]
- Lx List of Exhibits {7.6} 1 (list produced) [0:1]
- N \* Numbering style {2.4} 0, [0:5]
- Np Numbering style for paragraphs {4.1} 0 (unnumbered) [0:1]
- O \* Offset of page {2.4} .75i, [0:?] (0.5i, [0i:?] in troff)<sup>22</sup>

<sup>22.</sup> For nroff, these values are unscaled numbers representing lines or character positions; for troff, these values must be scaled.

Oc	Table of Contents page numbering style {10.1 0 (lower-case Roman), [0:1]
Of	Figure caption style {7.5} 0 (period separator), [0:1]
P	Page number, managed by MM {2.4} 0, [0:?]
Pi	Paragraph indent {4.1} 5 (nroff) 3 (troff), [0:?]
Ps	Paragraph spacing {4.1} 1 (one blank space between paragraphs), [0:?]
Pt	Paragraph type {4.1} 0 (paragraphs always left-justified), [0:2]
Pv	"PRIVATE" header {9.16} 0 (not printed), [0:2]
Rf	Reference counter, used by .RS macro {11.1} 0, [0:?], incremented by 1 for each .RS call.
S*	Troff default point size {2.4} 10, [6:36]
Si	Standard indent for displays {7.1} 5 (nroff) 3 (troff), [0:?]
T *	Type of <i>nroff</i> output device {2.4} 0, [0:2]
Tb	Table counter, used by .TB macro {7.5} 0, [0:?], incremented by 1 for each .TB call.
U *	Underlining style (nroff) for .H and .HU {2.4 0 (continuous underline when possible), [0:1]
W *	Width of page (line and title length) {2.4} 6i, [10:1365] (6i, [2i:7.54i] in troff) <sup>23</sup>

January 1981

Table header last

<sup>23.</sup> For nroff, these values are unscaled numbers representing lines or character positions; for troff, these values must be scaled.
